1. PROJECT OVERVIEW

In 1999, the Arizona Department of Transportation (ADOT) commissioned a study to:

- Establish a process to identify locations where a passing or climbing lane would provide benefit to the traveling public; and
- Rank the identified passing and climbing lanes locations by the most effective and feasible projects.

The end result of that study was a prioritized list of general locations for passing and climbing lanes within Arizona. In 2003, the study was updated to refine the previous methodology and to identify and reprioritize passing and climbing lane locations. Since this study was completed there has been a significant change in traffic patterns on the Arizona State Highway System that warranted the need to develop an updated list of passing and climbing lane candidate locations. The purpose of this study is to further enhance the 2003 methodology and to develop a new priority list of locations for passing and climbing lanes utilizing ADOT's more robust and current transportation datasets.

For the purpose of this study, passing and climbing lanes are defined as:

Passing Lane - *Additional lane on highways to facilitate the passing of all types of slow moving vehicles at locations other than sustained grades where passing opportunities are unavailable or very limited over a long stretch of highway.*

Climbing Lane - *Additional lane on steep upgrades to facilitate the passing of trucks and slow moving vehicles whose speed drops because of the sustained grade rather than a lack of passing opportunity over a long stretch of highway.*

Key benefits of incorporating passing and climbing lanes on highways include:

- Reduced delays at specific bottleneck locations, such as steep upgrades where slow-moving vehicles are present;
- Improved overall traffic operations by breaking up traffic platoons and reducing delays caused by inadequate passing opportunities over substantial lengths of highway; and
- Improved safety by reducing the need for passing vehicles to travel in the opposing lane.

While passing and climbing lanes are physically identical, they serve two different purposes. Usually passing lanes are used on two-lane highways, while climbing lanes are utilized on extended upgrade locations on two-lane and multilane highways.

- For two-lane highways with moderate to high traffic volume levels, lack of passing opportunities at regular intervals often results in long queues and poor performance. In lieu of costly widening projects, adding a passing lane at these locations alleviates the problem.
- For two-lane highways with extended upgrade locations, trucks and other slow moving vehicles experience significant drop in speed causing long queues and poor performance even with low traffic volume levels. Adding a climbing lane at these locations alleviates the problem and

significantly enhances safety by reducing the need for passing vehicles to maneuver into the opposing lane.

- For multilane highways, "no passing" zones are not an issue. However, a highway with extended upgrade locations and high truck traffic causes the trucks to experience a significant drop in speed results in excessive queuing and unsafe conditions. Adding a climbing lane at these locations alleviates the problem.

For these reasons, this study identified, evaluated, and prioritized passing and climbing lanes for the following scenarios:

- Passing lanes on two-lane highways
- Climbing lanes on two-lane highways
- Climbing lanes on multilane highways

PURPOSE AND NEED

With the ultimate purpose of enhancing safety and improving mobility, the *Climbing and Passing Lane Prioritization Study* was initiated to develop a prioritized list of candidate locations for climbing and passing lanes. The need for this study stems directly from ADOT's desire to increase safety and mobility along the Arizona State Highway System. The project purpose is demonstrated with the following statement of need:

- Update the Methodology. The previous study and methodology has not been updated since 2003. ADOT now has more accurate data and several newer datasets which could be utilized to enhance the previous methodology to produce better recommendations.
- Update the List of Passing/Climbing Lane Locations. Since the last update, there has been a significant change in traffic patterns on the Arizona State Highway System that warranted the need to develop an updated list of passing and climbing lane candidate locations. In addition, several of the recommendations from the previous study have since been implemented and the list has to be updated.
- Address Safety and Improve Mobility. Adding a passing/climbing lane along an existing highway is one of the most cost effective ways to enhance safety and improve mobility. New passing/climbing lane locations would provide a tremendous benefit to the traveling public.

PROJECT CHARTER

At the first Technical Advisory Committee (TAC) meeting, a *Project Charter* was developed with assistance from members of the TAC. As part of the Project Charter, a *Mission Statement* and *Goals* were developed to provide guidance to the study team.

Mission Statement

Develop a needs based prioritization for Climbing and Passing Lane locations on the Arizona State Highway System

Study Goals

Quality - Enhance safety and improve mobility; when typical design standards can't be met, reference the 2010 Highway Safety Manual for additional guidance; work towards objective and needs based prioritization for climbing and passing lanes; consider best practices from other states

Communication - Create a website to house climbing and passing lane study documents; reach every team member and/or intended recipient when communicating

Issue Resolution - Be proactive with resolving issues; understand the process for how this team moves issues forward and resolve issues timely; discuss at TAC meetings as necessary to communicate decisions to all team members

Teamwork - Interrelationships understood; work together to meet the challenge; take ownership of the study

Schedule - Keep and attend scheduled meetings; meet the delivery dates for the prioritization

Budget - Identify projects that can realistically be programmed; sensitivity to the route and route continuity (best bang for the dollar); communicate the need for specified funding for climbing/passing lanes

Project Delivery - Reach consensus on how to prioritize; include functional class factor when setting priorities; prepare a needs based prioritization that is defendable and can be reviewed annually – the end result is the list

TECHNICAL ADVISORY COMMITTEE

The study is guided by a Technical Advisory Committee (TAC). The role of the TAC is to provide technical guidance, support, advice, suggestions, recommendations, and to perform document reviews throughout the study process. TAC members included representatives from:

ADOT Statewide Project Management

ADOT Engineering Districts

ADOT Multimodal Planning

ADOT Traffic Design/Safety

ADOT Partnering Section

ADOT Roadway Design

ADOT State Engineer's Office

ADOT Communications Division

Federal Highway Administration

AGENCY/STAKEHOLDER COORDINATION

To develop a thorough understanding of the issues, deficiencies, and needs, the study team identified a core group of stakeholders and conducted two rounds of interviews. The stakeholders included representatives from each ADOT District office. The study team also sent out email notifications to each Council of Governments (COGs) and Metropolitan Planning Organizations (MPOs) to request feedback. Stakeholders' feedback summary is presented in later chapters of this document.

ADOT PARTNERING PROCESS

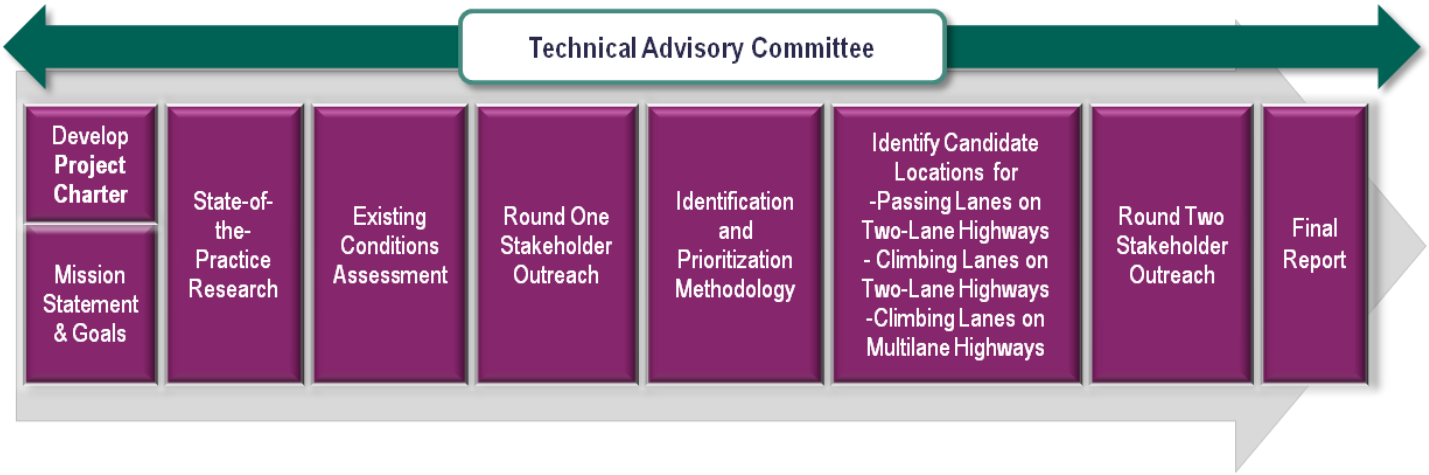
The *Climbing and Passing Lane Prioritization Study* was conducted as per the guidelines of ADOT's Partnering Process. Partnering is a process of collaborative teamwork to achieve measurable results through agreements and productive working relationships. The Partnering Principles include Communication, Commitment, Cooperation, and Continuous Improvement, and assist project teams to jointly solve problems, increase work efficiency, improve the project delivery process, and build and strengthen relationships. Project teams that agree on measurable goals, and utilize the partnering principles are more successful, and meet or exceed budget and schedule goals. In short, Partnering is a formal way for groups to work together and resolve issues.

The ADOT Partnering Office assisted with facilitating the creation of the collaborative partnership agreement. In addition, the Partnering facilitator assisted with setting up the measurement tool, Partnering Evaluation Program, or PEP. At the end of each TAC meeting, members were requested to complete and submit the PEP forms.

STUDY PROCESS

An eight step comprehensive process was used to complete this study. The study team maintained contact with TAC and stakeholders by meeting at regular intervals through the course of the study. Figure 1.1 illustrates the process utilized for this study.

Figure 1.1: Study Process



PASSING/CLIMBING LANES - STRATEGIC HIGHWAY SAFETY PLAN (SHSP)

ADOT recently adopted a Statewide SHSP; that is intended to be a "living" implementation document, coordinating the efforts of individual Emphasis Areas to the overall goals and objectives of the SHSP. The 2014 Arizona SHSP is a data-driven, strategic approach to reduce fatalities and serious injuries on state roads. The 2014 SHSP update defines 12 Emphasis Areas focused on improving specific areas of roadway safety. During the SHSP update process, the roadway infrastructure improvements were identified as an effective countermeasure.

SHSP Section 14: Roadway Infrastructure and Operations | Lane / Roadway Departure

This emphasis area addresses head-on crashes associated with highway segments. A head-on crash typically occurs when a vehicle crosses a centerline or a median and collides with an approaching vehicle, or when a driver travels the wrong way in a traffic lane. Head-on crashes are often a result of a driver's inadvertent actions, such as running off the road, or deliberate actions, such as performing unsafe passing maneuvers.

SHSP Section 14 – Goals and Objectives

The Emphasis Area goal for SHSP Section 14 is to, "reduce fatalities and the occurrence of serious injuries on all public roadways in Arizona through enhance roadway infrastructure and operations." The objectives for reducing the number of head-on fatal crashes are:

- Keep vehicles from encroaching into the opposite lane,
- Minimize the likelihood of a car crashing into an oncoming vehicle, and
- Reduce the severity of crashes that occur.

Effectiveness of Strategies and Proposed Action

The construction of passing and climbing lanes is a strategy that supports the SHSP Section 14 goals and objectives. A variety of studies conducted over the last twenty years have shown that the addition of passing and climbing lanes on highways reduces accident rates. Jacobs validated the safety benefit of adding passing and climbing lanes by conducting a crash analysis of selected location on both two-lane and multi-lane highways. The results of this analysis are documented on page 28 and 29 of this document.

2. PREVIOUS STUDIES, REPORTS, AND RESEARCH

ADOT'S PREVIOUS METHODOLOGY TO IDENTIFY AND PRIORITIZE PASSING LANE LOCATIONS

The process for identifying and prioritizing passing lanes on the Arizona State Highway System was first developed by the *1999-2000 Climbing/Passing Lane Study* and later updated in the *2003 Passing Lane Prioritization Update*. The *2003 Passing Lane Prioritization Update* identified issues in the 1999-2000 Study methodology and developed an enhanced methodology to identify and rank candidate passing lane locations. This section provides a summary of the methodology developed as part of the 2003 Study and are currently employed by ADOT to identify candidate locations and to establish an ultimate priority list of locations for passing lanes.

Step 1. **Identify "Universe" of Candidate Locations.** Table 2.1 provides a summary of the datasets utilized to develop a "Universe" of potential passing lane locations. Using this data, the state highway system is divided into smaller segments to reflect roadway segments with similar roadway characteristics (i.e., segments with identical AADT, number of lanes, truck percentage, etc.). Level of Service (LOS) is then calculated for each segment based on a volume-to-capacity (VC) ratio to ensure equal weights were given to each segment. Segments with an LOS of B or worse are identified and used to create a list of preliminary locations for a passing lane.

Table 2.1: Current Passing Lanes Methodology Data Items and Sources

Data Item	Data Source
Number of Travel Lanes	Roadway Log
Annual Average Daily Traffic (AADT)	HPMS/Historical Traffic Volume Database
Passing Length, No Passing Length	Striping Database
Directional Distribution	HPMS/Historical Traffic Volume Database
K Factor	HPMS/Historical Traffic Volume Database
Seasonal Adjustment Factors	ADOT Data Center
Truck Percentage	HPMS/Historical Traffic Volume Database
Highway Geometrics	ADOT Data Center
Speed	ADOT Data Center
Terrain	HPMS
Accidents	ALISS Accident Database – Traffic Records

Source: 2003 Passing Lane Prioritization Update

Step 2. **Compare Candidate Locations to Locations Recommended by ADOT Engineering Districts.** Based on their local knowledge, ADOT District Engineers create a list of recommended locations for a passing lane. The District's Engineer's candidate locations are then compared to the "Universe" candidate locations developed in Step 1. If candidate locations identified in Step 1 were not recommended by the District Engineers, roadway segments are verified against the data items presented in Table 2.1. A list of all candidate locations is developed based on locations identified in Step 1 and verified District Engineer recommendations.

Step 3. **Select Preliminary List of Candidate Locations.** Utilizing Highway Capacity Manual (HCM) methods, the LOS is determined for each candidate location. On a two-lane highway, the estimated LOS is based on two factors:

a. *Percent-Time-Spent-Following* reflects the average percentage of time a vehicle on a highway spends following other vehicles. Percent-time-spent-following is estimated from the demand flow rate, the directional distribution of traffic, and the percentage of no-passing zones.

b. *Average-Travel-Speed* represents the actual speed a vehicle achieves on a highway (not speed limit) after taking into consideration factors such as grade, percentage of no passing zones, traffic volumes etc.

Segments with a LOS of D or worse are identified and used to create a list of preliminary candidate locations of passing lanes.

Step 4. **Filter Preliminary List of Candidate Locations.** The preliminary list of candidate locations identified in Step 3 are compared against ADOT's Five-Year Transportation Facilities Construction Program. Candidate locations that are programmed are removed from the preliminary list in the ranking program in Step 5.

Step 5. **Rank Preliminary Candidate Passing Lanes on Two-Lane Highways**. The preliminary list of candidate locations is ranked using performance criteria displayed in Table 2.2. For each performance criterion a standard score is computed for each candidate location; the standard score indicates how much the criterion deviates from the mean of all candidate locations. A total score for each candidate is computed by summing points for each criterion. Based on the total score of the candidate, the segments are ranked and divided into three tiers (with each tier representing a range of project scores).

Table 2.2: Performance Criteria for Ranking Candidate Passing Lane Locations

Performance Criteria	Maximum Number of Points
Mobility (Existing level-of-service)	5
Percent-time-spent-following	10
Average-travel-speed	5
Passing related accidents	10
Accident rate	10

Source: 2003 Passing Lane Prioritization Update

Step 6. **Compare Preliminary Candidates with Candidates Identified By ADOT Districts.** For segments recommended by the ADOT Engineering Districts in Step 2, data is verified and evaluated to determine the need for a passing lane at the location. On a case by case basis, additional analysis may include review of grade, truck percentages, AADT, etc.

Step 7. **Review of Preliminary Candidates by ADOT Districts.** ADOT Engineering Districts review the preliminary list of ranked candidate locations for the following information:

a. Candidate location programmed or scoped for passing lanes or widening,
b. Passing lane already exist, and

c. Viability or constructability.

Step 8. **Ultimate List of Ranked Candidate Locations for Passing Lanes after Districts Review.** Upon review by the ADOT Engineering Districts, an ultimate list of candidate locations for passing lanes on two-lane highways is prepared by eliminating all segments that were either programmed or deemed not viable. This ultimate list is re-ranked using the procedures outlined in Step 5.

STATE-OF-THE-PRACTICE RESEARCH FOR PASSING LANES

Reviewing current practices and methodologies utilized by state Department of Transportation (DOT) agencies and relevant technical literature often provides insight into best practices that ADOT can utilize to enhance or streamline the identification and prioritization of passing lanes.

Literature Review

Kansas Department of Transportation (KSDOT)

Based on the *Design Guidelines for Passing Lanes on Two-Lane Two-way Rural Roads in Kansas* study conducted by KSDOT, the following are methods and procedures utilized by KSDOT to identify and prioritize passing lanes.

Overview: KSDOT utilizes a two-level process to determine highway segments that need passing lane(s). The two-level process includes:

- Network Level Analysis - Two-lane rural highway segments that operate at a LOS below a predefined acceptable level are identified. HCM LOS procedures for rural two-lane highways are utilized to develop AADT service levels. Figure 2.1 illustrates the suggested minimum AADT for LOS B and C in level and rolling terrain that KSDOT utilizes to warrant a passing lane(s).
- Project Level Analysis - Highway segments identified at the network level are ranked on the basis of their need for passing lanes. Utilizing a computer simulation tool, such as TWOPAS, detailed analysis of different passing lane length, spacing, and configuration is conducted.

Location Criteria: Location criteria can be grouped into four main considerations:

- Safety
  - Distance to side road or driveway intersections within and immediately after passing lane section as well as high volume side road intersection
  - Minimum sight distance
- Improved traffic performance
  - Select locations where there have been limited passing opportunities for approximately two miles or more and where field study shows substantial platooning (vehicles traveling together as a group, unable to pass)
  - Level terrain where a field study shows platooning
  - Leading away, rather than into, areas of traffic congestion (defined as no passing zones, reduced speed limit)
  - Start passing lanes on a horizontal curve to the left rather than right

  - Use TWOPAS to minimize percent time of day
- Design consistent with driver's expectation
  - On or immediately after a restricted passing opportunity that causes platooning
  - Length of segment
- Minimized construction costs
  - Avoid bridges, culverts, deep cuts, and high fills
  - Spacing between passing lanes is intended to make the passing lanes function as a coordinated system

Figure 2.1: KSDOT Suggested Minimum AADT for LOS B and C in Level and Rolling Terrain

		Projected Design Year AADT									
% Trucks		10		15		20		30		40	
LOS		B	C	B	C	B	C	B	C	B	C
% "no-passing" zones	0%	3900	6200	3700	5890	3520	5600	3210	5110	2950	4690
	20%	3460	5630	3290	5340	3130	5080	2850	4630	2620	4260

Source: KSDOT Design Guidelines for Passing Lanes on Two-Lane Two-way Rural Roads in Kansas

Missouri Department of Transportation (MODOT)

In 2004, MODOT conducted the *Benefits and Design/Location Criteria for Passing Lanes Study* to establish criteria for determining where passing lanes could improve LOS and safety on Missouri highways and to develop recommendations for the design, signing, and marking of passing lanes. The following is a summary of the results and recommendations provided in study.

Overview: MODOT utilizes two types of criteria to determine where passing lanes could provide LOS and safety benefits on Missouri highways:

- Screening Criteria - utilized to screen an entire network of two-lane highways for potential passing lane candidate locations.
- Site-Specific Criteria - utilized to screen a specific roadway section where passing lanes may provide substantial LOS and safety benefits and that warrant additional field investigation.

A review of pre- and post-passing lane conditions was conducted at three different sites. Overall, it was found that the overall queue time improved by 10-31% in comparison to a conventional two-lane highway without passing lanes. At the three sites, LOS conditions improved from LOS levels of C and D to LOS levels of A and B with the inclusion of passing lanes. In addition, accident frequency per mile, per year, was reduced by 12-24% compared to two-land highways without passing lanes.

Location Criteria: Preliminary Screening Criteria:

- Traffic volumes - Site section for passing lanes focuses on two-lane highways with existing and projected traffic volumes between 5,000 and 20,000 vehicles daily.
- Available Length of Roadway - Utilizing HCM methods, roadway segments capable of installing a passing lane of an optimal length. The study recommends a minimum available roadway length of 2.50 miles as a preliminary screening criterion.
- Planned or Programmed Improvements at the Site - Sites that are already programmed for four-lane highway improvements should be removed from consideration for passing lanes.

Site-Specific Criteria:

- Truck Volume - Based on AASHTO's Green Book, identify isolated steep upgrades and downgrades in which passing lanes can be strategically placed to pass slow-moving vehicles.
- Operating Speed - The study suggests that passing lanes are appropriate for two-lane highway sections with 85th percentile speeds over 45 mph and are most suitable for locations with 85th percentile speeds over 55 mph.

Texas Department of Transportation (TxDOT)

TxDOT, in conjunction with the Texas Transportation Institute (TTI), completed the *Design Guidelines for Passing Lanes of Two-Lane Roadways* study in an effort to create a "Super 2" design criteria for inclusion in the TxDOT Roadway Design Manual. The three critical elements of the "Super 2" design criteria focused on passing lane length and spacing, lane and shoulder width requirements, and signing and marking strategies. The following is a summary of the passing lane design criteria developed by TxDOT.

Overview: To simulate the location of the passing lane sections, the advance microscopic simulation program TWOPAS was utilized to model two-lane, two-way rural highways with passing lanes. Hypothetically, two-lane highways were modeled and passing lane designs were tested that had passing lane spacing between one and eight miles and passing lane lengths between 0.25 and 2 miles. The study tested traffic volumes ranging between 400 and 1,000 vph, with a truck percentage between 0 to 40 percent.

Measures of operational performance utilized by TxDOT to determine the impact of the passing lanes on two-lane highways include:

- Percent time delay,
- Percent of vehicles in platoon,
- Speed,
- Lane Utilization,
- Platoon structure, and
- Time headway distribution.

Location Criteria: Based on the results of the simulation analysis, TxDOT developed a set of passing lane location criteria recommendations that included:

- Recommended passing lane length is presented in Figure 2.2. These values reflect higher speed limits for rural roads.
- Uphill grades are preferred sites over downhill grades. Passing lanes on significant uphill grades should extend beyond the crest of the hill.
- Passing lane sections should be placed to avoid major intersections.
- If present, minor intersections that do not require deceleration lanes should be located near the midpoint of passing lane sections, avoiding transition areas.

Figure 2.2: TxDOT Recommended Values of Length and Spacing by ADT and Terrain

ADT (vpd)		Recommended Passing Lane Length (mi)	Recommended Distance Between Passing Lanes (mi)
Level Terrain	Rolling Terrain		
≤1950	≤1650	0.8-1.1	9.0-11.0
2800	2350	0.8-1.1	4.0-5.0
3150	2650	1.2-1.5	3.8-4.5
3550	3000	1.5-2.0	3.5-4.0

Source: TxDOT Design Guidelines for Passing Lanes of Two-Lane Roadways

Peer Agency Review

In order to further examine current methodologies utilized by DOTs to identify and prioritize passing lanes, project team members contacted agency staff at Nevada, Colorado, Texas, New Mexico, and Missouri DOTs. Agency staff was asked to provide details on current processes and success stories; however, little feedback was received.

ADOT'S PREVIOUS METHODOLOGY TO IDENTIFY AND PRIORITIZE CLIMBING LANE LOCATIONS

This section provides a summary of the methodology developed as part of the 2003 Study and are currently employed by ADOT to identify candidate locations and to establish an ultimate priority list of locations for climbing lanes.

Step 1. **Identify "Universe" of Candidate Locations.** Table 2.3 provides a summary of the datasets utilized to develop a "Universe" of potential climbing lane locations. In addition, the American Association of State Highway and Transportation Officials (AASHTO) Policy on Geometric Design of Highways and Streets suggests that climbing lanes on two-lane highways are considered if all the following criteria exists:

a. The directional flow rate on the upgrade exceeds 200 vph
b. The directional flow rate for trucks on the upgrade exceeds 20 vph
c. Any one of the following conditions: a speed reduction of 10 mph for a typical heavy truck, LOS E or F on the grade, or a reduction of two or more levels-of-service from the approach segment to the grade.

Using this data, roadway segments that have a grade over 2.5 percent and a length of at least 500 ft are identified.

Table 2.3: Current Climbing Lanes Methodology Data Items and Sources

Data Item	Data Source
Number of Travel Lanes	Roadway Log
Annual Average Daily Traffic (AADT)	HPMS/Historical Traffic Volume Database
Percent Grade	GPS Data
Length of Grade	GPS Data
Passing Length, No Passing Length	Striping Database
Directional Distribution	HPMS/Historical Traffic Volume Database
K Factor	HPMS/Historical Traffic Volume Database

Truck Percentage	HPMS/Historical Traffic Volume Database
Highway Geometrics	ADOT Data Center
Speed	ADOT Data Center
Terrain	HPMS
Accidents	ALISS Accident Database – Traffic Records

Source: 2003 Passing Lane Prioritization Update

Step 2. Verify that "Universe" Candidate Locations Meet Minimum Criteria Requirements for a Climbing Lane. "Universe" candidate locations developed in Step 1 are verified against GIS data to ensure that they meet minimum criteria for climbing lanes (i.e., directional flow rate on upgrade exceeds 200 vph, and directional flow rate for trucks on the upgrade exceeds 20 vph). Candidates that do not meet the minimum criteria are eliminated from the "Universe."

Step 3. Compare Candidate Locations to Locations Recommended by ADOT Engineering Districts. Based on their local knowledge, ADOT District Engineers create a list of recommended locations for a climbing lane. The District's Engineer's candidate locations are then compared to the "Universe" candidate locations developed in Step 1. If candidate locations identified in Step 1 are not recommended by the District Engineers, roadway segments are verified against the data items presented in Table 2.3. A list of all candidate locations a developed based on locations identified in Step 1 and verified against District Engineer recommendations.

Step 4. Select Preliminary List of Candidate Locations. Utilizing HCM methods, the LOS is determined for each candidate location. On a two-lane highway, the estimated LOS is based on two factors:

a. Percent-Time-Spent-Following - reflects the average percentage of time a vehicle on a highway spends following other vehicles. Percent-time-spent-following is estimated from the demand flow rate, the directional distribution of traffic, and the percentage of no-passing zones.

b. Average-Travel-Speed - represents the actual speed a vehicle achieves on a highway (not speed limit) after taking into consideration factors such as grade, percentage of no passing zones, traffic volumes etc.

Segments with a LOS of D or worse are identified and used to create a list of preliminary candidate locations of climbing lanes.

Step 5. Filter Preliminary List of Candidate Locations. The preliminary list of candidate climbing lane locations identified in Step 3 are compared against ADOT's Five-Year Transportation Facilities Construction Program. Candidate locations that are programmed are removed from the preliminary list in the ranking program in Step 5.

Step 6. Rank Preliminary Candidate Climbing Lanes on Two-Lane Highways. The preliminary list of candidate locations is ranked using the performance criteria displayed in Table 2.4. For each performance criterion a standard score is computed for each candidate location; the standard score indicates how much the criterion deviates from the mean of all candidate locations. A total score for each candidate is computed by summing points for each criterion. Based on the total score of the candidate, the segments are ranked and divided into three tiers (with each tier representing a range of project scores).

Step 7. Compare Preliminary Candidates with Candidates Identified By ADOT Districts. For segments recommended by the ADOT Engineering Districts in Step 2, data is verified and a further evaluation is conducted to determine the need for a climbing lane at the location. On a case by case basis, additional analysis may include review of grade, truck percentages, AADT, etc.

Table 2.4: Performance Criteria for Ranking Candidate Climbing Lane Locations

Performance Criteria	Maximum Number of Points
Mobility (Existing level-of-service)	5
Percent-time-spent-following	10
Average-travel-speed	5
Passing related accidents	10
Accident rate	10

Source: 2003 Climbing Lane Prioritization Update

Step 8. Review of Preliminary Candidates by ADOT Districts. ADOT Engineering Districts review the preliminary list of ranked candidate locations for the following information:

a. Candidate location programmed or scoped for climbing lanes or widening,
b. Climbing lane already exist, and
c. Viability or constructability.

Step 9. Ultimate List of Ranked Candidate Locations for Climbing Lanes after Districts Review. Upon review by the ADOT Engineering Districts, an ultimate list of list of candidate locations for climbing lanes on two-lane highways is prepared by eliminating all segments that were either programmed or deemed not viable. This ultimate list is re-ranked using the procedures outlined in Step 5.

STATE-OF-THE-PRACTICE RESEARCH FOR CLIMBING LANES

Literature Review

Missouri Department of Transportation (MODOT)

In 2004, MODOT conducted the *Benefits and Design/Location Criteria for Passing Lanes Study* to establish criteria for determining where passing and climbing lanes could improve LOS and safety on Missouri highways and to develop recommendations for the design, signing, and marking of climbing lanes. The following is a summary of the results and recommendations provided in study.

Overview: MODOT utilizes two types of criteria to determine where climbing lanes could provide LOS and safety benefits on Missouri highways:

- Screening Criteria - utilized to screen an entire network of two-lane highways for potential climbing lane candidate locations.
- Site-Specific Criteria - utilized to screen a specific roadway sections where climbing lanes may provide substantial LOS and safety benefits and that warrant additional field investigation.

Location Criteria: Preliminary Screening Criteria:

- Traffic volumes - Site section for focuses on two-lane highways with existing and projected traffic volumes between 5,000 and 20,000 vehicles daily.

- Available Length of Roadway - The study recommends a minimum available roadway length of 2.50 miles as a preliminary screening criterion.
- Planned or Programmed Improvements at the Site - Sites that are already programmed for four-lane highway improvements should be removed from consideration for climbing lanes.

Site-Specific Criteria:

- Truck Volume or percent trucks
- Operating Speed

Following the guidelines set forth by the AASHTO *Green Book*[4], to justify the addition of a climbing lane on a two-lane highway, the MODOT verifies that the required criteria are met. Climbing lanes may also be justified, even where the critical length of grade is not exceeded, based on LOS analysis conducted with HCM procedures.

South Dakota Department of Transportation (SDDOT)

SDDOT's *Roadway Design Manual* incorporates detailed criteria guidelines that need to be satisfied in order to justify the inclusion of a climbing lane. The following is a summary of the guidelines presented in the SDDOT *Roadway Design Manual*.

Overview: Three conditions, reflecting economic conditions, should be satisfied to justify climbing lanes. These include the following:

- Upgrade traffic flow rate > 200 vph. With traffic data obtained from the projects scope or from the Transportation Inventory Management Office, use design hourly volume-two way (DHV) and multiply by 0.6 (50 to 70 percent range) to obtain traffic flow one way.
- Upgrade truck flow rate > 20 VPH. From traffic data received use trucks % (T DHV) and multiply by condition 1 above. *Note: Recreational vehicle (RV) traffic is not included with the percentage of trucks; therefore if condition 2 does not exist with given truck %, this condition may be satisfied if a significant part of traffic is RV.*
- One of the following conditions exist:
  - A 10 mph or greater speed reduction is expected for a typical heavy truck.
  - LOS E or F exists on the grade. LOS based on average traveling speed for a two-lane highway.
  - A reduction of two or more levels-of-service is experienced when moving from the approach segment to the grade.

If all three of the above mentioned conditions exist an analysis shall be completed to determine the location of a climbing lane. The *Roadway Design Manual* recommends that when warranted, the climbing lane should begin when the truck

speed is reduced 10 mph below the average running speed for all traffic. The end of the climbing lane should extend until trucks obtain a speed within 10 mph of the average running speed for all traffic or until sufficient sight distance is available. In addition, climbing lanes should be a minimum of 0.5 miles long excluding tapers to be effective.

Peer Agency Review

In order to further examine current methodologies utilized by DOTs to identify and prioritize climbing lanes, project team members contacted agency staff at Nevada, Colorado, Texas, New Mexico, and Missouri DOTs. Agency staff were asked to provide details on current processes and success stories; however, little feedback was received.

3. EXISTING CONDITIONS ASSESSMENT

This chapter presents a summary of the existing passing and climbing lane location inventory and also provides a *"Before and After"* assessment of the safety and traffic improvements due to the construction of passing/climbing lanes.

DATA COLLECTION

ADOT's GIS section, Bridge group, and Traffic Records Division now manage a robust and more accurate repository of transportation databases than what was available during the previous study. At the onset of the study, the study team met with the GIS Section and ADOT PM to obtain the data identified in Table 3.1. Each database was reviewed for quality and the data was adjusted where appropriate.

Table 3.1: Data Items and Sources

Dataset	Source
Accident Location Information and Surveillance System (ALISS) Crash Database	ADOT Traffic Records
Striping plans (Passing distance lengths)	ADOT Traffic Records
Traffic volumes (AADT) - Current and past 5 years - Vehicle classification, K & D factors - Seasonal adjustment factors	ADOT GIS section
Future traffic volumes	ADOT GIS section
Functional classification	ADOT GIS section
Highway video log	ADOT GIS section
Highway centerline GPS data	ADOT GIS section
Highway log - Shoulders - Median type - Lane width - Grade/Terrain - Speed - Traffic Signals	ADOT GIS section
ATIS Dataset	ADOT GIS section
Statewide Transportation Improvement Program (STIP)	ADOT MPD
Highway Performance Monitoring System (HPMS) - Beginning MP, Ending MP - Ownership - Lanes - Access Center Lane - Median and median width - Curve and Curve Length - Horizontal Alignment - Vertical Alignment - Urban and Rural	ADOT GIS section
Transportation Data Management System (TDMS)	ADOT GIS section
Bridges and Structures	ADOT Bridge Group
As-built drawings	ADOT ROW

EXISTING PASSING AND CLIMBING LANES INVENTORY

Compiling a comprehensive inventory of existing passing/climbing lane locations is an essential first step before evaluating the need for new passing/climbing lanes. ADOT's existing passing and climbing lanes data set was used as the starting point. Each passing/climbing lane location and length was verified against aerial imagery. Table 3.2 provides a summary of the number of passing and climbing lanes in each ADOT District. Approximately 169 passing/climbing lanes currently exist on two-lane highways and the length of the passing lanes varies from 0.25 miles to over a mile. Shorter passing lanes are typically less effective than longer passing lanes especially on highways with higher traffic volume levels.

On multilane highways, "no passing" zones is not an issue; extended upgrade locations coupled with high truck traffic warrant the need for climbing lanes on multilane highways. Currently, only four climbing lanes exist on Arizona's multilane highways however, a few are now under construction and a few more are in the design stage.

Figures 3.1 to 3.8 illustrate the locations of existing passing and climbing lanes in each ADOT District.

Table 3.2: Passing and Climbing Lanes by ADOT Districts

ADOT District	Passing/Climbing Lanes on Two-Lane Highways				Climbing Lanes on Multilane Highways
	< 0.5 mile	0.5 - 1 mile	> 1 mile	Total	> 1 mile

EVALUATION OF EXISTING PASSING/CLIMBING LANES – *"BEFORE AND AFTER"* COMPARISON

To assess the benefits of passing/climbing lanes, crash history and traffic operational performance was evaluated for the *"Before and After"* conditions for twelve existing passing/climbing lanes. Crash data was collected for two years before construction and two years after construction of the passing/climbing lane. To account for the influence of the passing/climbing lane, crashes within five miles downstream were also included in the analysis. Number of crashes, crash rate, injury crash rate, and number of *equivalent* property damage only crashes (EPDO: Equivalent Property Damage Only) were estimated for each location. EPDO represents the relative number of Property Damage Only (PDO) or non-injury crashes. It takes into account the number of crashes and the severity of the crashes. Each crash is converted to an equivalent PDO using a multiplier for each crash type. Table 3.3 lists the multipliers used to derive the EPDO value.

Table 3.3: EPDO Conversion Factors

Crash Type	Equivalent PDO Crashes (multiplier)
Non-injury or Property Damage Only (PDO)	1
Possible Injury	2
Minor Injury	4
Severe Injury	7
Fatal	12

After a passing/climbing lane was constructed on two-lane highways:

- Number of crashes decreased by 33%
- Crash rate decreased by 31%
- Injury crash rate decreased by 46%
- EPDO measure decreased by 36%

After a climbing lane was constructed on multilane highways:

- Number of crashes decreased by 37%
- Crash rate decreased by 51%
- Injury crash rate decreased by 74%
- EPDO measure decreased by 48%

Crash rates are expressed as crashes per million Vehicle Miles Traveled (VMT). Crash data for years 2008-2012 was used during this analysis.

Only two locations were available to evaluate the before/after conditions for climbing lanes on multilane lanes. Table 3.4 includes a summary of crash data analysis for climbing lanes on multilane lanes.

Table 3.4: "*Before and After*" Crash Analysis

** EPDO: Equivalent Property Damage Equivalent Only Value*

Level of service (LOS) for each location was determined *before and after* the passing/climbing lane was constructed. After a passing/climbing lane was constructed, LOS for each assessed location improved by at least one level for both two-lane highways. Table 3.5 summarizes the level of service analysis.

4. ROUND ONE STAKEHOLDER OUTREACH

Round one of stakeholder outreach included individual meetings with each ADOT District staff and email outreach to the Council of Governments (COGs) and Metropolitan Planning Organizations (MPOs). Meetings with the Districts were conducted between August 12 – 20, 2013. The primary purpose of these meetings was to obtain feedback from each District about their preferred locations for passing/climbing lanes based on their understanding of the area's travel patterns, crash history, and roadway improvement needs. District staff input was vital to understanding the unique needs and concerns in each District.

Based on lessons learned from the previous studies, a comparison of the subjective analysis/feedback from each District against the data-driven technical analysis results is essential to

- Validate the methodology to identify and prioritize passing/climbing lane locations
- Identify any inconsistencies or errors in the background data
- Identify reasons when District recommendations do not match technical analysis results
- Obtain Districts consensus' on the methodology and study results

Tables 4.1 to 4.8 summarize each District's suggested preliminary locations for passing and climbing lanes on two-lane and multilane highways based on their understanding of the District roadways and Figures 4.1 to 4.8 display the tabular information. *The beginning and ending milepost ranges in each table represent the general problem area and not the exact location and length of the desired passing/climbing lane location.*

Once the Districts feedback was obtained, and email was sent to each COG/MPO requesting their feedback with respect to the District's preference and preliminary methodology for identifying and prioritizing passing/climbing lanes. Very little feedback was received from the COGs and MPOs.

5. IDENTIFICATION AND PRIORITIZATION METHODOLOGY

Based on lessons learned from the previous study, state-of-the-practice research, TAC feedback, and Districts recommendations, separate methodologies were developed for identifying and prioritizing:

- Passing lanes on two-lane highways
- Climbing lanes on two-lane highways
- Climbing lanes on multilane highways

METHODOLOGY FOR PASSING LANES ON TWO-LANE HIGHWAYS

Figure 5.1 illustrates the steps utilized to identify potential candidate locations for passing lanes on two-lane highways and Figure 5.2 illustrates the steps for prioritization of the candidate locations. Once a preliminary list of potential candidates was identified, three different prioritization methods (Table 5.1) were evaluated:

- Option 1 – Subjective Rating Method: In this method, each prioritization criteria was assigned a weight and a maximum number of points based on discussions with TAC and Districts.
- Option 2 – Z Score Method: In this method, each prioritization criteria is given the same weight. However, the points/score are determined using a z score value that is based on each record's relative distance from the mean of all records. This method is based solely on technical analysis.
- Option 3 – Combined Method: This method represents a combination of subjective and technical analysis. In this method, the z score from Option 2 is multiplied by weights used in Option 1.

Figure 5.1: Identification Process for Passing Lanes on Two-Lane Highways

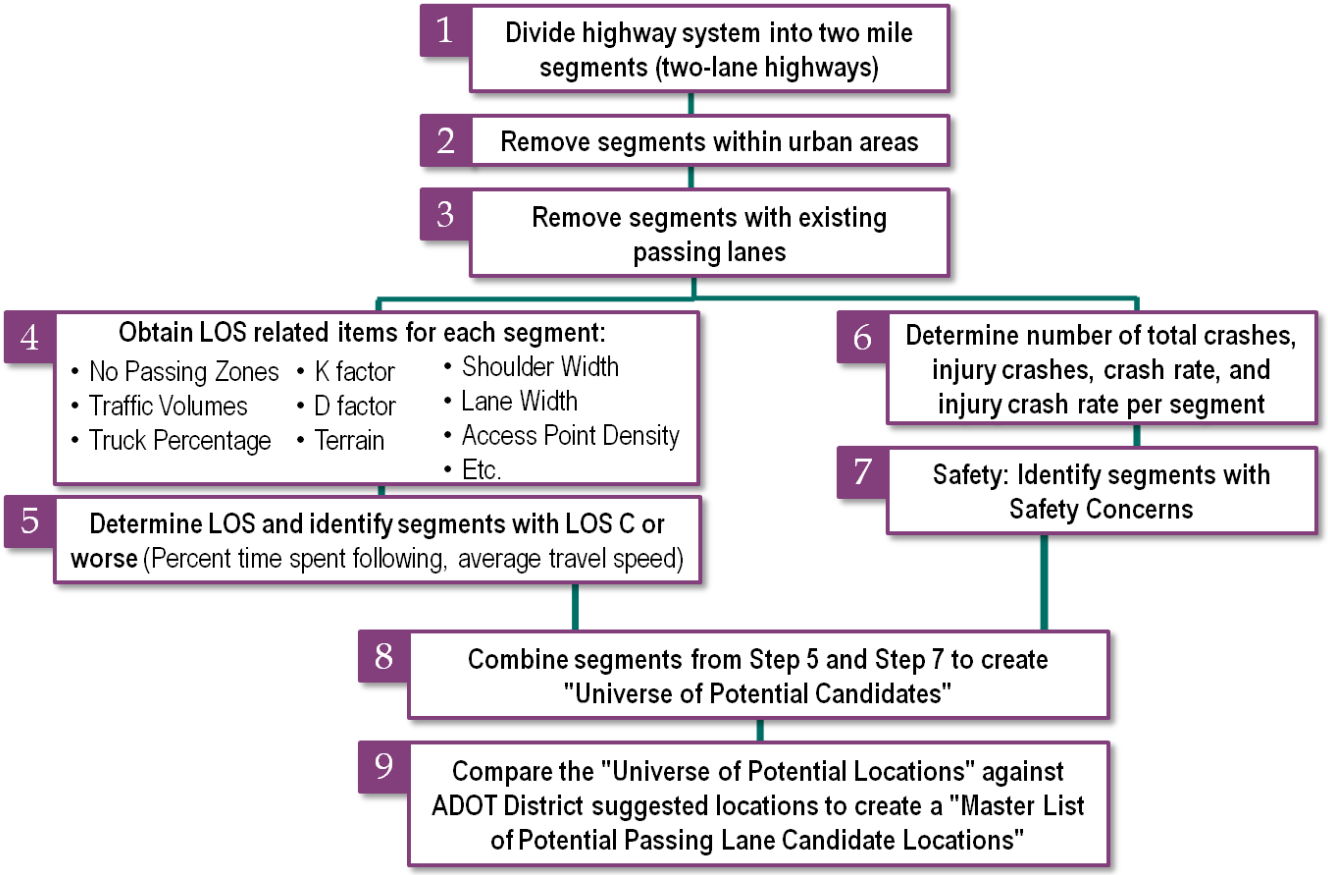

Figure 5.2: Prioritization Process for Passing Lanes on Two-Lane Highways

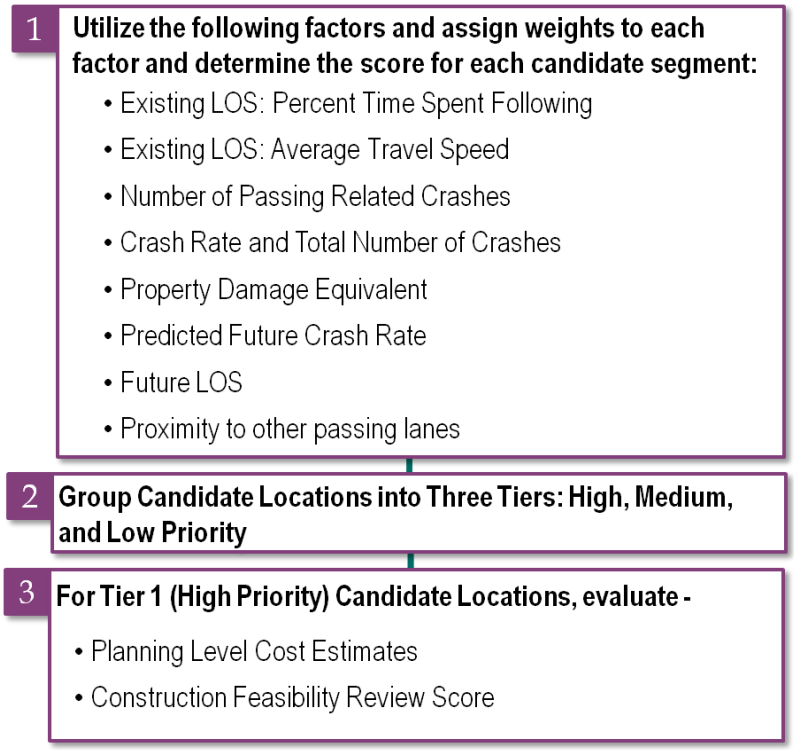

Table 5.1: Prioritization Criteria for Passing Lanes on Two-Lane Highways

Criteria	Option 1: Subjective Rating Method		Option 2: Z Score Method	Option 3: Combined Method	
	Points	Overall Percent	Z Score (From Analysis)	Z Score (From Analysis)	Overall Percent
Mobility	**14**	**35%**			**35%**
Existing LOS: PTSF – Percent Time Spent Following	4	10%			10%
Existing LOS: PFFS – Percent of Free Flow Speed	4	10%			10%
Proximity to Adjacent Passing/Climbing Lanes	2	5%			5%
Future LOS: PTSF – Percent Time Spent Following	2	5%			5%
Future LOS: PFFS – Percent of Free Flow Speed	2	5%			5%
Safety	**20**	**50%**			**50%**
Existing Crash Rate	5	13%			13%
Existing Crash Severity (EPDO)	7	18%			18%
Existing Passing Related Crash Rate	4	10%			10%
Future Crash Severity (Future EPDO)	4	10%			10%
Construction Feasibility	**6**	**15%**			**15%**
Cost per Lane Mile (Low, Med, or High - Assessed Based on Physical Constraints)	3	7.5%			7.5%
Bridge Widening Cost (Low, Medium, High - Assessed based on additional SQFT)	3	7.5%			7.5%
Total Points	**40**	**100%**			**100%**

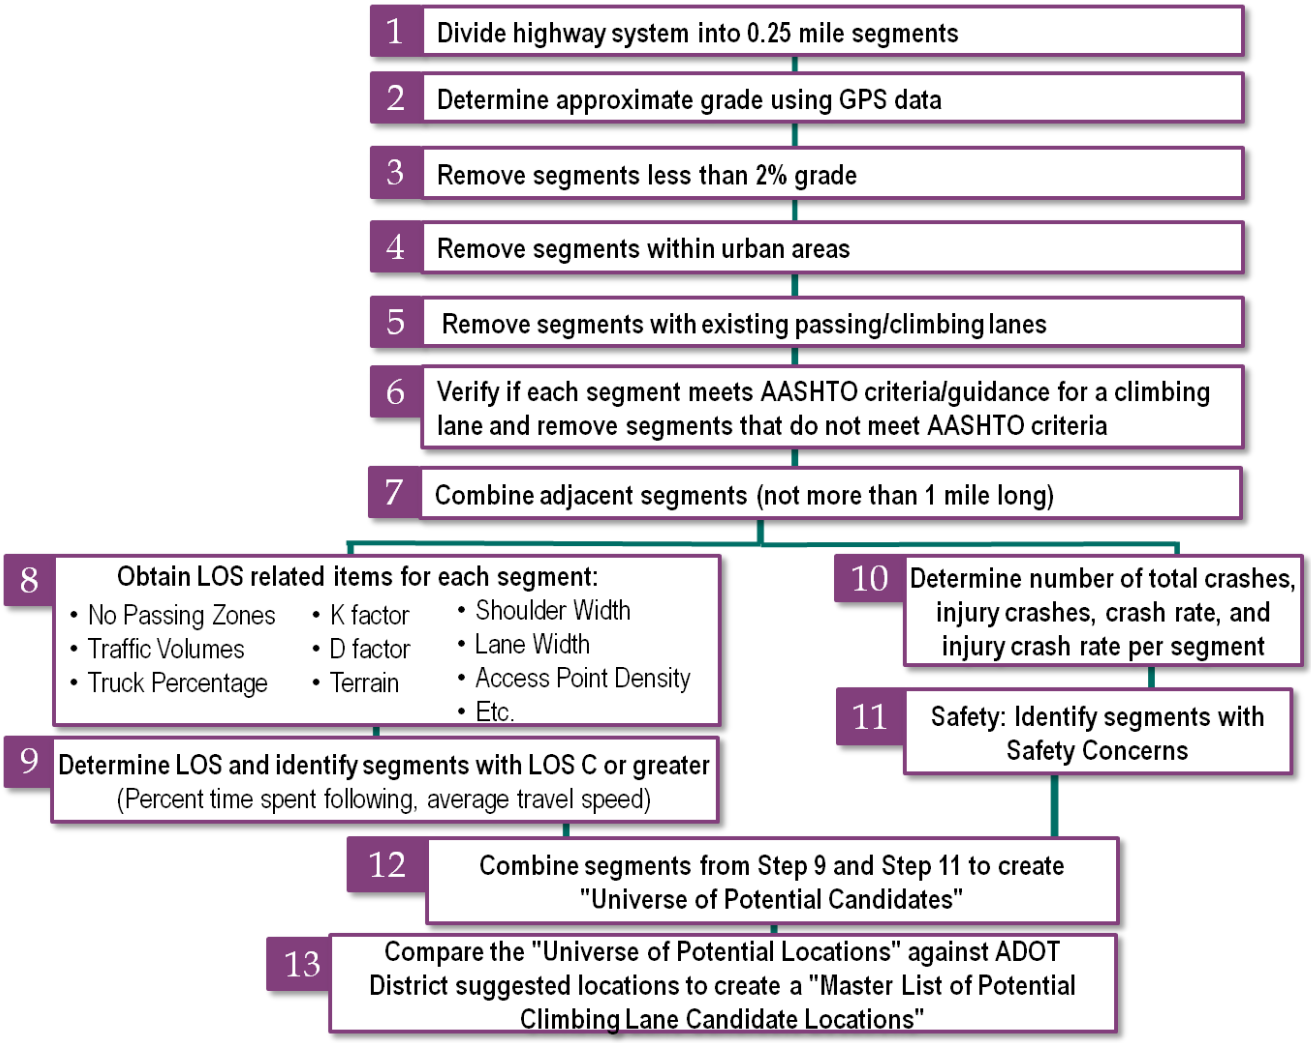
In this method, each prioritization criteria is given the same weight. However, the points/score are determined using a z score value that is based on each record's relative distance from the mean of all records.

METHODOLOGY FOR CLIMBING LANES ON TWO-LANE HIGHWAYS

Figure 5.3 illustrates the steps utilized to identify potential candidate locations for climbing lanes on two-lane highways. The prioritization process for climbing lanes is the same as that for passing lanes on two-lane highways and illustrated in Figure 5.2. Once a preliminary list of potential candidates was identified, similar to passing lanes, three different prioritization methods (Table 5.1) were evaluated:

- Option 1 – Subjective Rating Method: In this method, each prioritization criteria was assigned a weight and a maximum number of points based on discussions with TAC and Districts.
- Option 2 – Z Score Method: In this method, each prioritization criteria is given the same weight. However, the points/score are determined using a z score value that is based on each record's relative distance from the mean of all records. This method is based solely on technical analysis.
- Option 3 – Combined Method: This method represents a combination of subjective and technical analysis. In this method, the z score from Option 2 is multiplied by weights used in Option 1.

Figure 5.3: Identification Process for Climbing Lanes on Two-Lane Highways



METHODOLOGY FOR CLIMBING LANES ON MULTILANE HIGHWAYS

Figure 5.4 illustrates the steps utilized to identify potential candidate locations for climbing lanes on multilane highways and Figure 5.5 illustrates the steps for prioritization of the candidate locations. Once a preliminary list of potential candidates was identified, three different prioritization methods (Table 5.2) were evaluated:

- Option 1 – Subjective Rating Method: In this method, each prioritization criteria was assigned a weight and a maximum number of points based on discussions with TAC and Districts.
- Option 2 – Z Score Method: In this method, each prioritization criteria is given the same weight. However, the points/score are determined using a z score value that is based on each record's relative distance from the mean of all records. This method is based solely on technical analysis.
- Option 3 – Combined Method: This method represents a combination of subjective and technical analysis. In this method, the z score from Option 2 is multiplied by weights used in Option 1.

Figure 5.4: Identification Process for Climbing Lanes on Multilane Highways

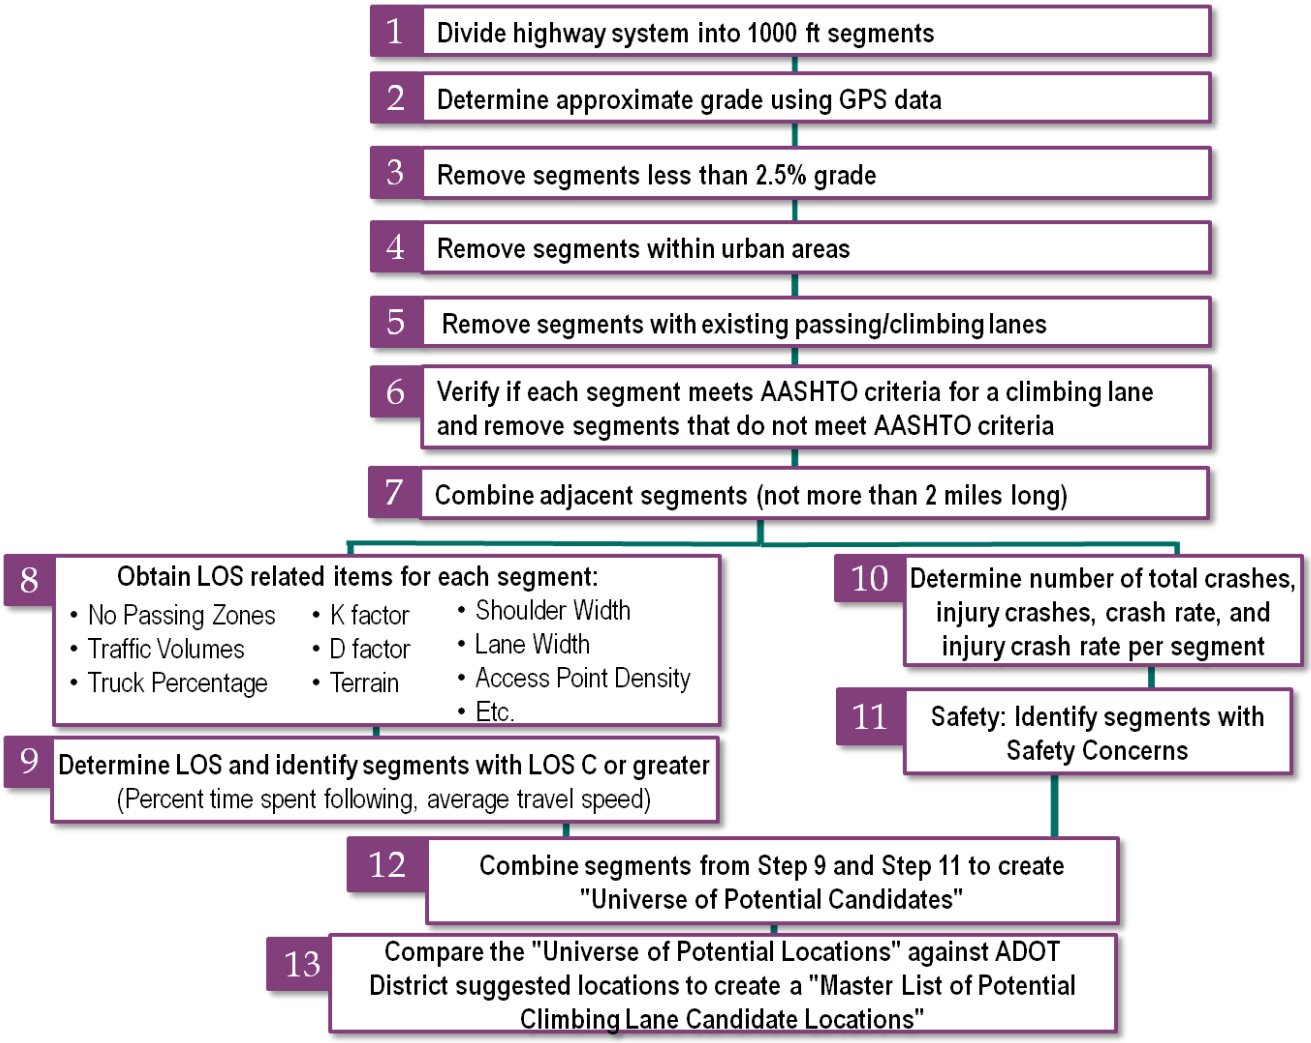


Figure 5.5: Prioritization Process for Climbing Lanes on Multilane Highways

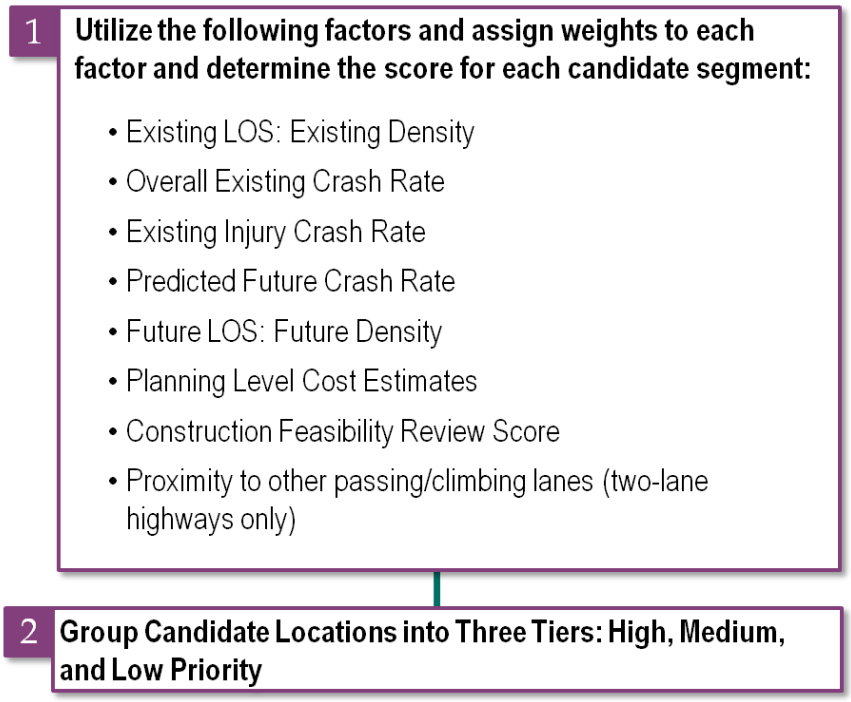

Table 5.2: Prioritization Criteria for Climbing Lanes on Multilane Highways

Criteria	Option 1: Subjective Rating Method		Option 2: Z Score Method	Option 3: Combined Method	
	Points	Overall Percent	Z Score (From Analysis)	Z Score (From Analysis)	Overall Percent
Mobility	**14**	**35%**			**35%**
Existing LOS: Existing Density	8	20%			10%
Proximity to Adjacent Passing/Climbing Lanes	2	5%			5%
Future LOS: Future Density	4	10%			5%
Safety	**20**	**50%**			**50%**
Existing Crash Rate	5	13%			13%
Existing Crash Severity (EPDO)	7	18%			18%
Existing Passing Related Crash Rate	4	10%			10%
Future Crash Severity (Future EPDO)	4	10%			10%
Construction Feasibility	**6**	**15%**			**15%**
Cost per Lane Mile (Low, Medium, or High - Assessed Based on Physical Constraints)	3	7.5%			7.5%
Bridge Widening Cost (Low, Medium, High - Assessed based on additional SQFT)	3	7.5%			7.5%
Total Points	**40**	**100%**			**100%**

ROUND TWO STAKEHOLDER OUTREACH

Round two of stakeholder outreach included individual meetings with each ADOT District staff and email outreach to the COGs and MPOs. Meetings with the Districts were conducted between February 20 – 28, 2014. The primary purpose of these meetings was to review the analysis results and obtain feedback regarding the prioritization methodology and ranking of the candidate locations.

TAC and the Districts felt that the results from Option 1 and Option 3 were reasonable, however, the overall consensus was to utilize results from Option 1 for the final recommendations.

Once the TAC and Districts feedback was obtained, and email was sent to each COG/MPO requesting their feedback with respect to the study results. Very little feedback was received from the COGs and MPOs.

6. SUMMARY RESULTS – PASSING LANES ON TWO-LANE HIGHWAYS

Table 6.1 presents the list of candidate locations for passing lanes on two-lane highways. The candidate locations are ranked at the statewide and district level and grouped into three tiers – high, medium, and low priority. Figure 6.1 illustrates the statewide location of the passing lanes. Figures 6.2 to 6.9 illustrate the passing lane locations in each District followed by project summary sheets for the Tier 1 locations. Table A1 in Appendix A lists the candidate locations, ranking, tier level, and also includes detailed information about evaluation criteria and scoring.

Locations identified for passing lanes in Table 6.1 represent only the general problem area and not the exact location and length of the passing lanes.

Non-Injury Crashes	15
Average Crash Rate	0.73 *per million vehicle miles traveled*
Equivalent Property Damage Value	48

Source: Accident Location Information and Surveillance System (ALISS) 2008-2013

Construction Constraints/Feasibility

Constraints: No physical constraints.

General Location Assessment: Road is straight before and within the segment. One small section at the end has a center left turn lane. High volumes

Number of Bridges: 5
Cost to Widen Bridges: $253,800.00

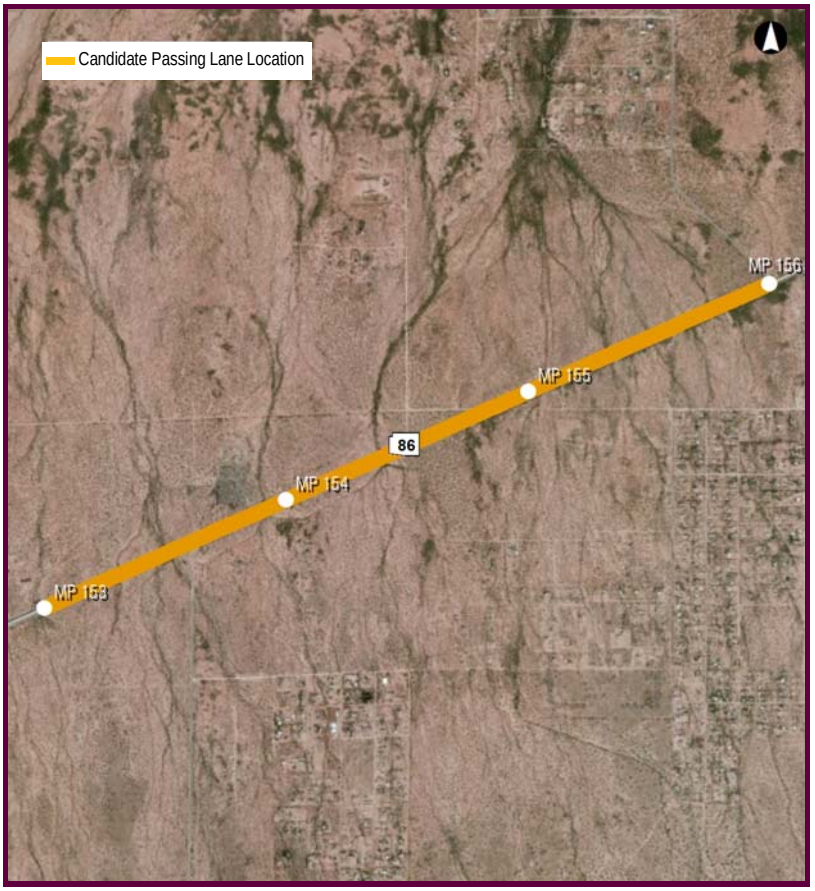
Environmental Overview

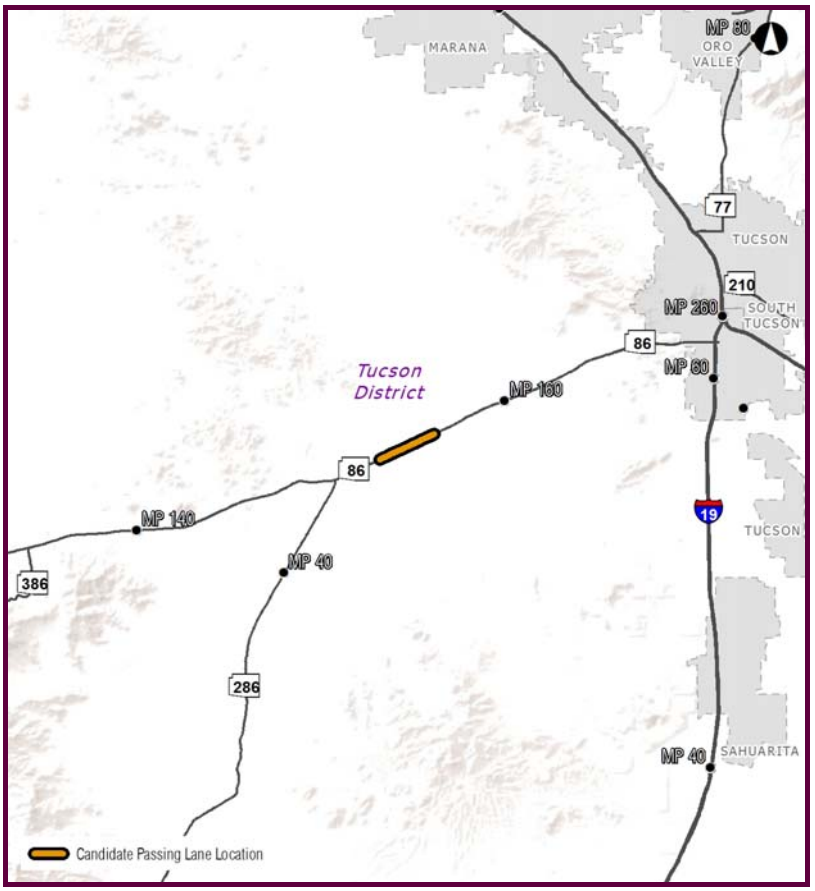
Land Ownership: Private Land; State Trust Land; Bureau of Land Management

Potential Environmental Constraints: Based on a broad GIS analysis of readily available data, within a quarter-mile of the proposed project area the following environmental constraints may be present: 100-Year Floodplain; CO Maintenance Area; BLM VRM Class III

Cultural Resources

Number of Cultural Sites: 4
Eligible Sites (AZSITE): 3
Potential 4(f) Sites (AZSITE): 1
No. of Land Agencies (0.5 mile): 3
Total Cultural Sites: 11
Cultural Resource Density: Low





7. SUMMARY RESULTS – CLIMBING LANES ON TWO-LANE HIGHWAYS

Table 7.1 presents the list of candidate locations for climbing lanes on two-lane highways. The candidate locations are ranked at the statewide and district level and grouped into three tiers – high, medium, and low priority. Figure 7.1 illustrates the statewide location of the climbing lanes. Figures 7.2 to 7.8 illustrate the climbing lane locations in each District followed by project summary sheets for the Tier 1 locations. Table A2 in Appendix A lists the candidate locations, ranking, tier level, and also includes detailed information about evaluation criteria and scoring.

Locations identified for climbing lanes in Table 7.1 represent only the general problem area and not the exact location and length of the climbing lanes.

Note:
Statewide Rank = Projects ranking statewide
District Rank = Projects ranking within District only
Tier Level = High, medium, and low priority

In some instances, need for a climbing and passing lane may have been identified in the same vicinity. The TAC recommended leaving the overlaps/duplicates in place to illustrate that those locations were deemed warranted in both analysis.

Safety Analysis

Total Number of Crashes 111
Number of Fatal Crashes 2
Injury & Possible Injury Crashes 35
Non-Injury Crashes 74
Average Crash Rate 1.91 *per million vehicle miles traveled*
Equivalent Property Damage Value 224

Source: Accident Location Information and Surveillance System (ALISS) 2008-2013

Construction Constraints/Feasibility

Constraints: no major physical constraints

General Location Assessment: Grade doesn't look that steep and then goes into a downhill

Number of Bridges:

Cost to Widen Bridges: $0.00

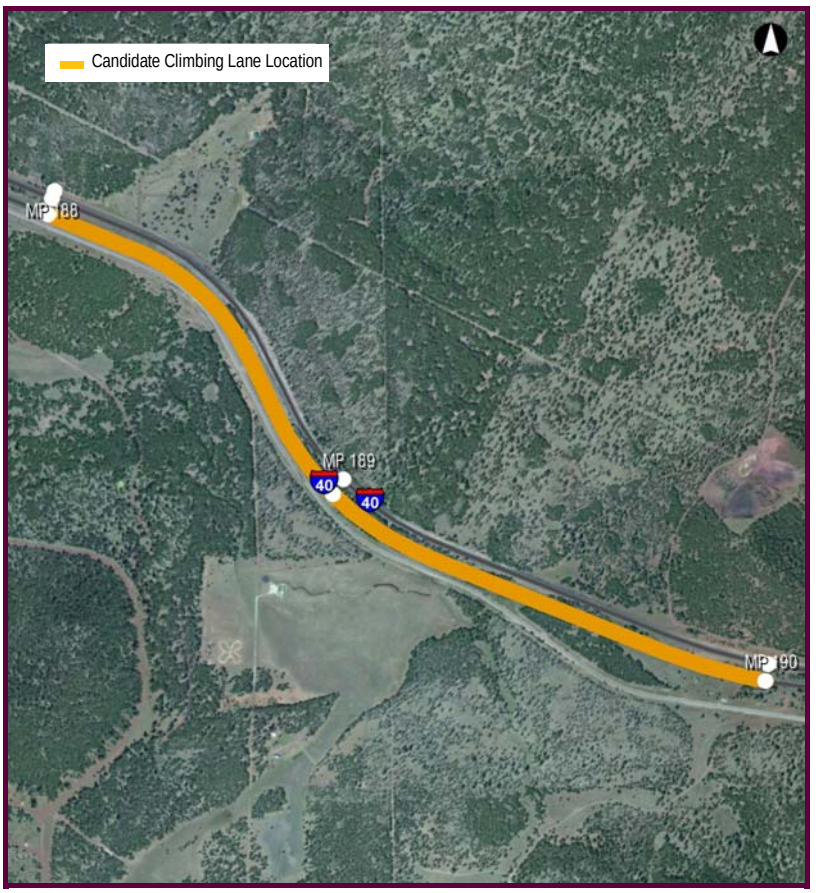
Environmental Overview

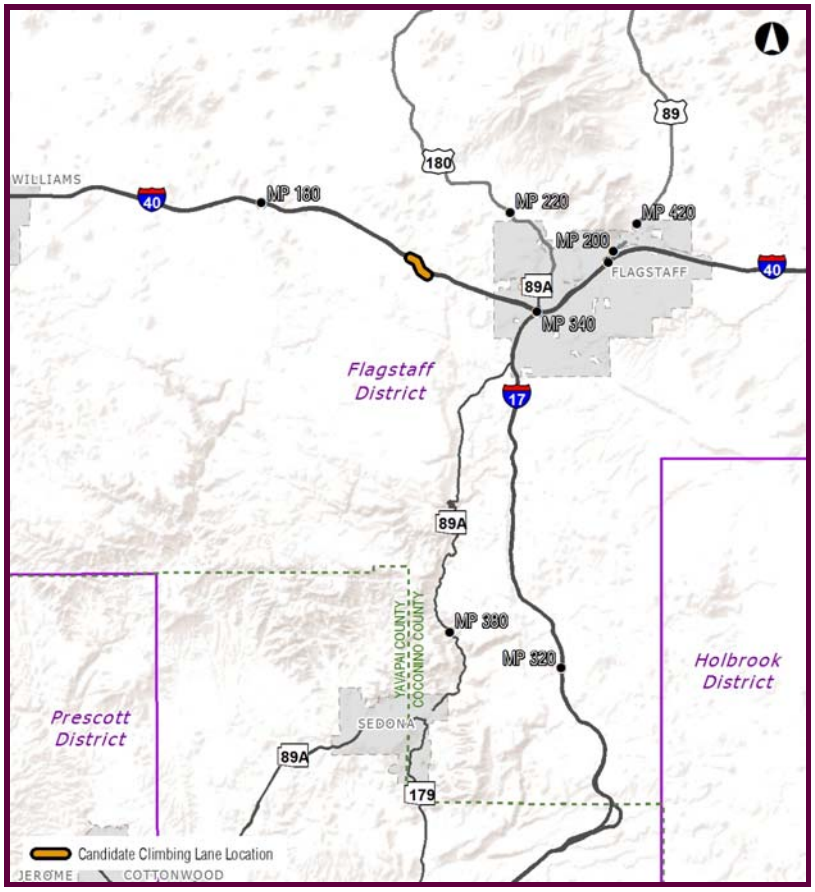
Land Ownership: Private Land; Coconino National Forest; Navajo Army Depot

Potential Environmental Constraints: Based on a broad GIS analysis of readily available data, within a quarter-mile of the proposed project area the following environmental constraints may be present: Potential Wildlife Linkage; Wetlands; Camp Navajo Superfund Site

Cultural Resources

Number of Cultural Sites: 2
Eligible Sites (AZSITE): 2
Potential 4(f) Sites (AZSITE): 1
No. of Land Agencies (0.5 mile): 5
Total Cultural Sites: 10
Cultural Resource Density: Low





I 17 SB: MP 281 - MP 285 Climbing Lane (Multilane Highways) Statewide Rank: 3

Project Details

Route: I 017 Direction: SB
BMP: 281 EMP: 285
District: Prescott County: Yavapai
Ranking: 3 Tier: 1

Roadway Characteristics

Terrain/Max Slope: 6.08 K-Factor: 0.11
Speed Limit (MPH): 65 Directional Split: 62/38
Existing AADT: 26,171 Future AADT: 40,000
Existing LOS: C Future LOS: D
Truck %: 16%

Safety Analysis

Total Number of Crashes 103
Number of Fatal Crashes 1
Injury & Possible Injury Crashes 14
Non-Injury Crashes 88
Average Crash Rate 1.44 *per million vehicle miles traveled*
Equivalent Property Damage Value 153

Source: Accident Location Information and Surveillance System (ALISS) 2008-2013

Construction Constraints/Feasibility

Constraints: Roadside cliffs that may need to be cut into

General Location Assessment: Can't tell what the grade is, but it starts to go downhill at the end. Very curvy and would benefit from a passing lane

Number of Bridges:

Cost to Widen Bridges: $0.00

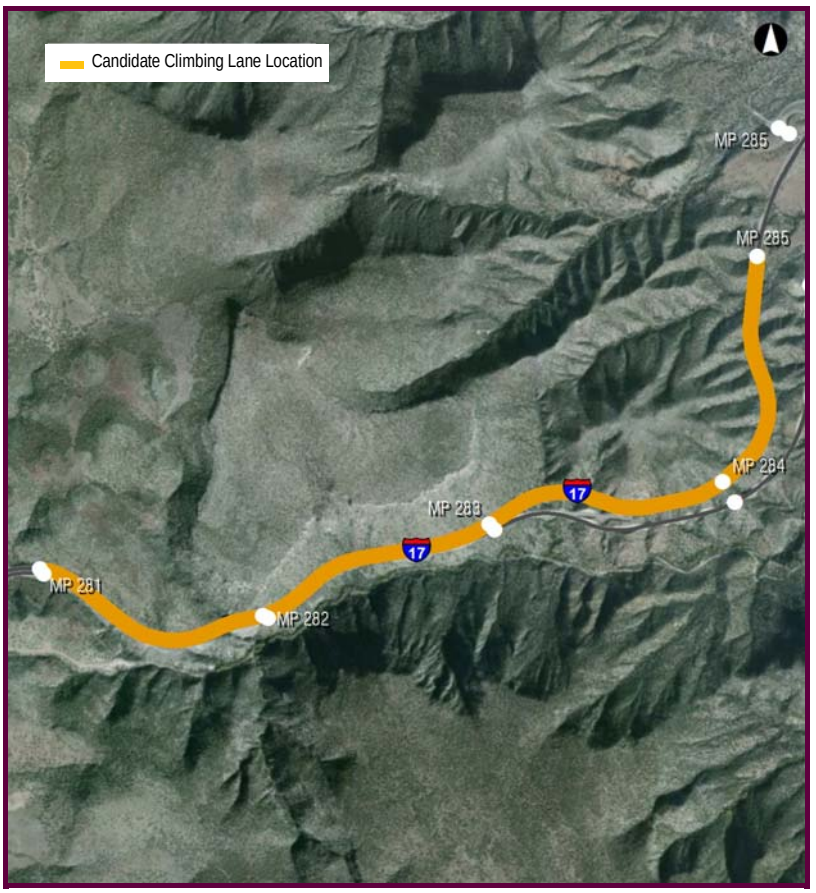
Environmental Overview

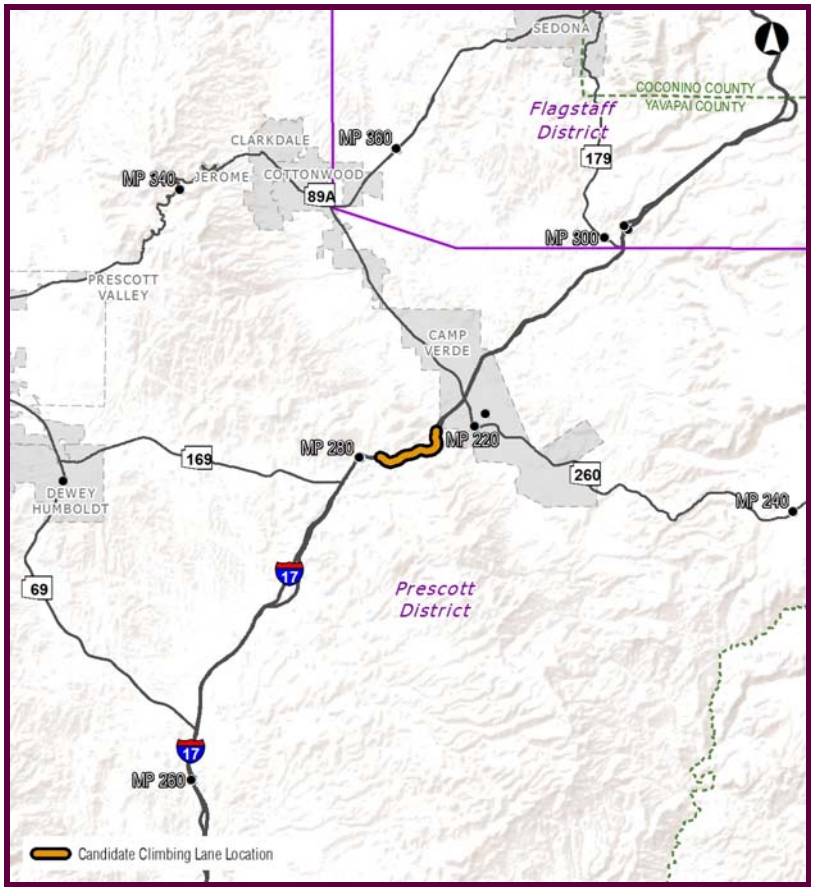
Land Ownership: Prescott National Forest

Potential Environmental Constraints: Based on a broad GIS analysis of readily available data, within a quarter-mile of the proposed project area the following environmental constraints may be present: Verde fault zone; Potential Wildlife Linkage; Wetlands

Cultural Resources

Number of Cultural Sites: 1
Eligible Sites (AZSITE): 0
Potential 4(f) Sites (AZSITE): 0
No. of Land Agencies (0.5 mile): 1
Total Cultural Sites: 2
Cultural Resource Density: Low





I 10 WB: MP 306 - MP 302 Climbing Lane (Multilane Highways) Statewide Rank: 4

Project Details

Route: I 010 Direction: WB
BMP: 306 EMP: 302
District: Safford County: Cochise
Ranking: 4 Tier: 1

Roadway Characteristics

Terrain/Max Slope: 3.15 K-Factor: 0.09
Speed Limit (MPH): 35 Directional Split: 56/44
Existing AADT: 29,608 Future AADT: 40,750
Existing LOS: C Future LOS: D
Truck %: 22%

Safety Analysis

Total Number of Crashes 51
Number of Fatal Crashes 5
Injury & Possible Injury Crashes 19
Non-Injury Crashes 27
Average Crash Rate 0.63 *per million vehicle miles traveled*
Equivalent Property Damage Value 159

Source: Accident Location Information and Surveillance System (ALISS) 2008-2013

Construction Constraints/Feasibility

Constraints: Bridge at 302.5

General Location Assessment: Grade does not seem that steep. Appears they may be widening segment that could be used to add a climbing lane

Number of Bridges:

Cost to Widen Bridges: $0.00

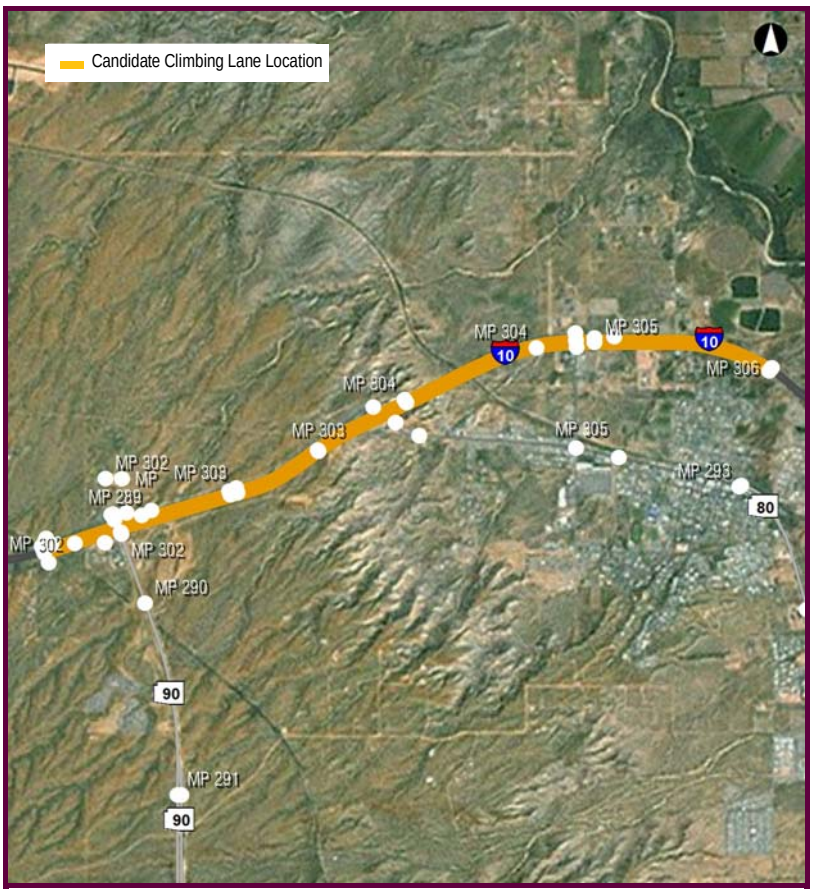
Environmental Overview

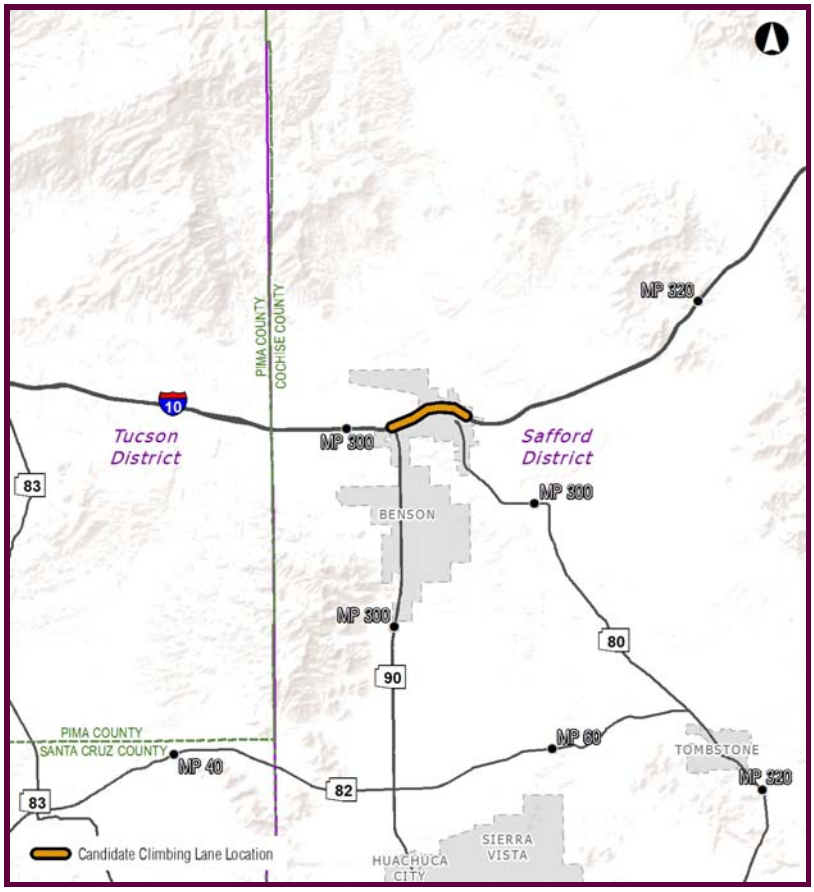
Land Ownership: Private Land

Potential Environmental Constraints: Based on a broad GIS analysis of readily available data, within a quarter-mile of the proposed project area the following environmental constraints may be present: Wetlands; Leaking Underground Storage Tank

Cultural Resources

Number of Cultural Sites: 14
Eligible Sites (AZSITE): 7
Potential 4(f) Sites (AZSITE): 3
No. of Land Agencies (0.5 mile): 2
Total Cultural Sites: 26
Cultural Resource Density: Medium





I 17 NB: MP 307 - MP 311 Climbing Lane (Multilane Highways) Statewide Rank: 5

Project Details

Route: I 017 Direction: NB
BMP: 307 EMP: 311
District: Flagstaff County: Yavapai
Ranking: 5 Tier: 1

Roadway Characteristics

Terrain/Max Slope: 6 K-Factor: 0.1
Speed Limit (MPH): 75 Directional Split: 58/42
Existing AADT: 16,050 Future AADT: 28,500
Existing LOS: A Future LOS: B
Truck %: 11%

Safety Analysis

Total Number of Crashes 76
Number of Fatal Crashes 0
Injury & Possible Injury Crashes 17
Non-Injury Crashes 59
Average Crash Rate 1.73 *per million vehicle miles traveled*
Equivalent Property Damage Value 131

Source: Accident Location Information and Surveillance System (ALISS) 2008-2013

Construction Constraints/Feasibility

Constraints: no major physical constraints

General Location Assessment: Winding, long uphill climb

Number of Bridges:

Cost to Widen Bridges: $0.00

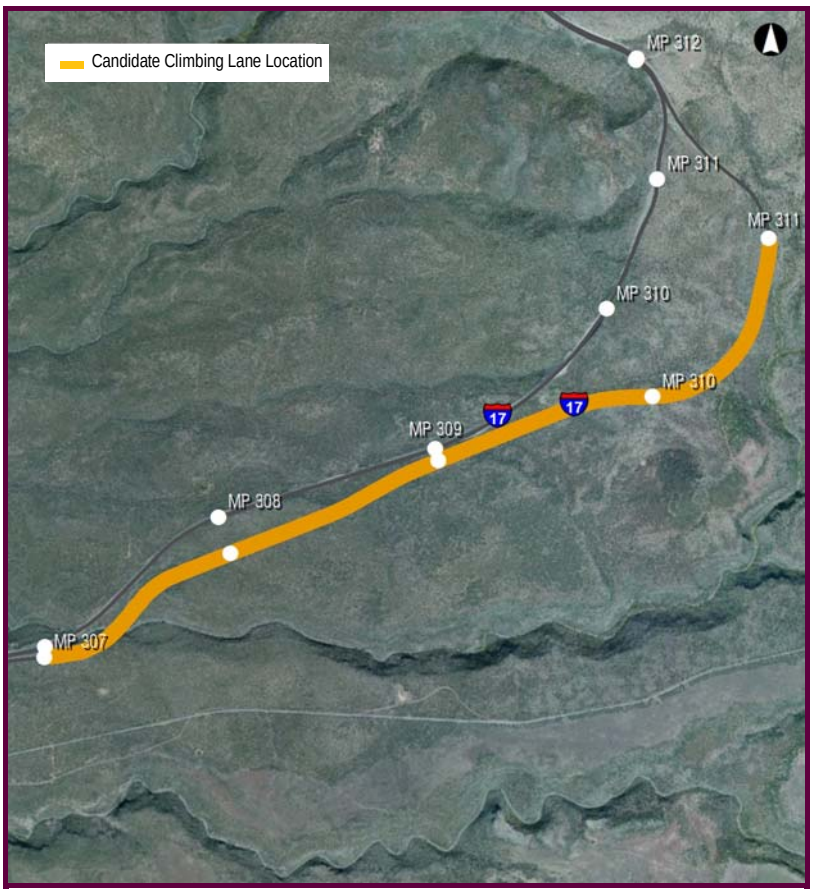
Environmental Overview

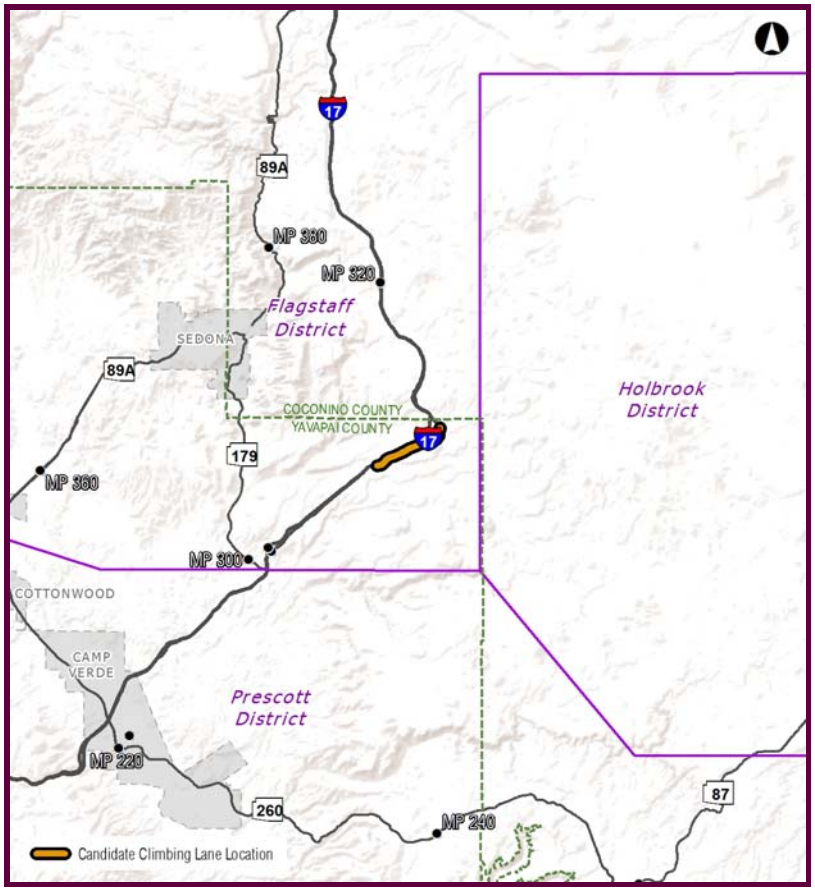
Land Ownership: Coconino National Forest

Potential Environmental Constraints: Based on a broad GIS analysis of readily available data, within a quarter-mile of the proposed project area the following environmental constraints may be present: Potential Wildlife Linkage; Wetlands

Cultural Resources

Number of Cultural Sites: 9
Eligible Sites (AZSITE): 5
Potential 4(f) Sites (AZSITE): 0
No. of Land Agencies (0.5 mile): 1
Total Cultural Sites: 15
Cultural Resource Density: Low





I 17 NB: MP 255 - MP 256 Climbing Lane (Multilane Highways) Statewide Rank: 6

Project Details

Route: I 017	**Direction:** NB
BMP: 255	**EMP:** 256
District: Prescott	**County:** Yavapai
Ranking: 6	**Tier:** 1

Roadway Characteristics

Terrain/Max Slope: 4.34	**K-Factor:** 0.1
Speed Limit (MPH): 75	**Directional Split:** 60/40
Existing AADT: 27,973	**Future AADT:** 38,500
Existing LOS: B	**Future LOS:** C
Truck %: 11%	

Safety Analysis

Total Number of Crashes	67
Number of Fatal Crashes	2
Injury & Possible Injury Crashes	28
Non-Injury Crashes	37
Average Crash Rate	0.87 *per million vehicle miles traveled*
Equivalent Property Damage Value	162

Source: Accident Location Information and Surveillance System (ALISS) 2008-2013

Construction Constraints/Feasibility

Constraints: Roadside cliffs that may need to be cut and a frontage rand turn off

General Location Assessment: Long steady, curvy incline in which trucks need to slow down. Slow trucks can cause major safety issues

Number of Bridges:

Cost to Widen Bridges: $0.00

Environmental Overview

Land Ownership: Bureau of Land Management

Potential Environmental Constraints: Based on a broad GIS analysis of readily available data, within a quarter-mile of the proposed project area the following environmental constraints may be present: Agua Fria NM; Potential Wildlife Linkage; Wetlands; BLM VRM Class II and Class III

Cultural Resources

Number of Cultural Sites:	13
Eligible Sites (AZSITE):	10
Potential 4(f) Sites (AZSITE):	0
No. of Land Agencies (0.5 mile):	1
Total Cultural Sites:	24
Cultural Resource Density:	Medium
