INTRODUCTION

Robust travel time data collection is possible using Bluetooth™ or Wi-Fi technology that matches anonymous MAC addresses from discoverable electronic devices (e.g., smart phones) to determine travel time along a roadway segment. Several hundred data points can be collected, and analyzed in real-time, each day. Anonymous Re-Identification (ARID), a term coined for local Arizona agencies, is commonly used for this technology and is inclusive or either Bluetooth™ or Wi-Fi technology.

The Arizona Department of Transportation (ADOT), Office of P3 Initiatives and International Affairs selected Lee Engineering to analyze the penetration rate of ARID technology to measure wait time of U.S. and Mexico bound personal vehicles at 6 (six) United States-Mexico Ports of Entry (POEs) in Arizona. The purpose of this study is for ADOT and stakeholders to have an understanding of ARID data collection technology, validity of measuring wait time at POEs, and recommendations on which POEs to install permanent ARID technology, in priority order. The Ports of Entry included in this study are:

Table 1. Arizona – Mexico Ports of Entry

| Port of Entry | City | Operating Hours | Total Volume of Personal Vehicles Entering the U.S. in 2014 (Jan-Dec) |
|--------------------|-----------|-----------------|---|
| San Luis I | San Luis | 24 Hours | 3,028,042 |
| DeConcini | Nogales | 24 Hours | 3,286,532 |
| Mariposa | Nogales | 6 AM to 10 PM | |
| Raul Hector Castro | Douglas | 24 Hours | 1,571,929 |
| Lukeville | Lukeville | 6 AM to 12 AM | 316,429 |
| Naco | Naco | 24 Hours | 298,368 |

PROJECT STAKEHOLDERS

A Technical Advisory Committee (TAC) was established to facilitate data collection and help guide the study. The following agencies were represented on the TAC:

- Arizona Department of Transportation, Multimodal Planning Division
- Arizona Department of Transportation, Safford District
- Arizona Department of Transportation, Tucson District
- Arizona Department of Transportation, Yuma District
- Federal Highway Administration
- Douglas International Port Authority
- Southeastern Arizona Governments Organization (SEAGO)
- City of Douglas, Arizona
- Municipio de Agua Prieta
- Cochise County

- Greater Nogales Santa Cruz County Port Authority
- Pima Association of Governments (PAG)
- City of Nogales
- Municipio de Nogales, Sonora
- Santa Cruz County
- Municipio de Sonoyta
- Greater Yuma Port Authority
- Yuma Metropolitan Planning Organization (YMPO)
- City of San Luis
- Municipio de San Luis Rio Colorado
- Secretaria de Infraestructura y Desarrollo Urbano (SIDUR)
- Secretaria de Comunicaciones y Transporte (SCT)
- U.S. Customs and Border Protection (CBP)
- Administración General de Aduanas (Mexican Customs)
- U.S. General Services Administration (GSA)

DATA COLLECTION

Lee Engineering and Crossborder Group collected travel time and traffic volumes in June and July of 2015 to evaluate the penetration rate or the sampling rate of Bluetooth or Wi-Fi anonymous re-identification technology at the six Arizona-Mexico POEs. Prior to field deployment, staff from Crossborder Group visited the six POEs along the Arizona-Sonora border to assess specific site location options and potential limitations for the deployment of video volume data collection and ARID technology equipment. Site locations were identified based on several factors including the availability of existing poles or parking areas for security, strength of cellular communications network, and traffic flow. The Technical Advisory Committee (TAC) provided input for preferred data collection sites and observation dates at each POE. The ease of installation, travel time between sites, avoiding holidays, and the overall project schedule was also considered.

Traffic volumes were obtained using Miovision™ video cameras and processing. To estimate the number of passenger vehicles only, trucks were removed from the count.

ARID travel time data collection devices developed by Post Oak Traffic Systems were used to collect travel times. The equipment included a deep cycle gel cell battery, data processing device, Bluetooth or Wi-Fi antenna, and cellular modem inside a Pelican hardcase. To minimize the chance of theft, the hardcase was joined to a fixed object with a heavy duty steel chain and lock or secured inside a locked vehicle. The pelican hardcase and an example arterial deployment are shown in Figure 1. The hardcase and antennas were secured to a light pole using locks and heavy duty steel chains.

Figure 1: ARID Deployment

The cellular communication allowed for monitoring and processing the ARID device data in real-time and alerted data collection staff to tampering, theft, or malfunction. If cellular service was not available at a deployment location, the data was stored within the device for upload to a computer and post-processing. Post Oak Traffic Systems provided the software hosting and processing which matched MAC addresses recorded by the ARID readers, which were later used to estimate sample size of wait times of personal vehicles entering and exiting the United States.

The drawback of ARID technology is that multiple signals may exist within a vehicle such as smart phones. This is usually a small number of the total data collected, but it may have skewed the data for this study's application. Additionally, we located the ARID devices in the field with the intent to collect data from passenger vehicles; however, this technology cannot differentiate between matches obtained from vehicles moving at the similar speeds (e.g., cargo trucks). Overall, this technology provides a good estimation of motor vehicle travel time, which, when installed permanently, can be disseminated to drivers to facilitate route choice.

ARID data collection using Bluetooth is currently being used in other states at their borders with Mexico and Canada; however, published information is not available regarding performance and capabilities of Bluetooth versus Wi-Fi enabled anonymous re-identification devices at Ports of Entry. A pilot field test of the ARID technology was performed using Bluetooth™ and Wi-Fi to evaluate the functionality of Bluetooth and Wi-Fi enabled anonymous re-identification devices at an Arizona - Mexico Port of Entry. The pilot field test served as the method of identifying the most appropriate technology for the six POEs in the study and was conducted for three hours on June 16th at the DeConcini Port of Entry. This location was selected based on the geometry of the POE, roadway ownership by ADOT, and accessibility. The Bluetooth and Wi-Fi ARID devices were deployed at the same time on opposite sides of the roadway to record the same vehicle flow. Interference between the Bluetooth and Wi-Fi ARID devices was not evident. By using cellular communications, the team was able to receive and analyze the data in real-time to determine whether Bluetooth™ or Wi-Fi resulted in a greater quantity of valid travel time matches. Wi-Fi yielded 4-5 times greater valid matches during the pilot deployment and was used for data collection at the remaining Ports of Entry.

Field equipment was deployed for at least two operating days at each POE. The team coordinated closely with the ADOT, FHWA, CBP, GSA, and appropriate agencies in Mexico at each POE throughout the data collection process. The location, collection times, and field

equipment deployment description was provided to the appropriate local jurisdiction or security office in order to obtain a permit or clearance to conduct the data collection effort. Additional information including contact information for personnel conducting the collection effort was also provided. A contact card was secured to all portable ARID devices in the case that any field issues were encountered, to ensure immediate attention could be provided to address the situation.

The field equipment deployment schedule of the ARID Wi-Fi and Miovision technologies is provided in Table 2. Although each Port of Entry deployed the equipment for at least two days, some of the observation hours were excluded due to POE operating hours or device adjustment time. The adjustment period occurs primarily during installation, when the ARID device requires time to equilibrate and begin identifying valid matches. Observation time was also excluded if there was evidence of device malfunction, either with the ARID sensors or the Miovision cameras.

Table 2: Data Collection Schedule

| Port of Entry | Data Collection Period | | Valid Data Hours Analyzed | |
|------------------------------|--------------------------|--------------------------|---------------------------|-----------|
| | Start | End | ARID Wi-Fi | Miovision |
| San Luis | Wednesday, July 01, 2015 | Saturday, July 04, 2015 | 33 | 62 |
| DeConcini (Nogales) | Tuesday, June 16, 2015 | Thursday, June 18, 2015 | 44 | 50 |
| Mariposa (Nogales) | Tuesday, June 16, 2015 | Thursday, June 18, 2015 | 21 | 25 |
| Raul Hector Castro (Douglas) | Thursday, June 18, 2015 | Sunday, June 21, 2015 | 54 | 60 |
| Lukeville | Monday, June 29, 2015 | Wednesday, July 01, 2015 | 41 | 26 |
| Naco | Thursday, June 18, 2015 | Saturday, June 20, 2015 | 40 | 48 |

The data summarized in the results can be found in a detailed form in the appendices. **APPENDIX A** includes the ARID Wi-Fi match data, including the travel time, average speed, and vehicle sample size in 15 minute periods. The Miovision data, which documents the total number of personal vehicles observed, is provided in **APPENDIX B**. The penetration rate analysis is included in **APPENDIX C**, and the delay data can be found in **APPENDIX D**.

DATA ANALYSIS

The purpose of the analysis was to determine whether ARID devices deployed at each Arizona-Mexico Port of Entry would collect a sufficient sample size of passenger vehicle travel time matches out of the total volume of passenger vehicles to confidently estimate wait times of U.S. and Mexico bound personal vehicles. The method in which crossing time, wait time, and delay are calculated are described in this section, along with a description and analysis of each Port of Entry.

METHODOLOGY

Penetration Rate Calculation:

The penetration rate is similar to sampling rate, which is essentially the number of unique devices detected by the ARID technology divided by the traffic volume for the same time period. The team used the following formula to calculate the penetration rate.

$$\text{Penetration Rate (\% of traffic)} = \frac{\# \text{ of unique devices detected (devices per hour)}}{\text{traffic volume (cars per hour)}}$$

The penetration rate was calculated using a comparison of the ARID Wi-Fi data to the Miovision video data, which captured the volume of personal vehicles. In both data collection methods, the quantity of matches or vehicles (samples) can be compared in terms of 15 minute periods. To reduce bias of truck traffic or multiple Wi-Fi enabled devices identified in passenger vehicles, 15 minute periods with less than either three ARID Wi-Fi samples or three Miovision samples were excluded. This threshold value is based on a review of Port of Entry data and past experience in analyzing data from this technology. It was observed that making comparisons between ARID and Miovision data in 15 minute periods with less than three samples did not provide enough data to provide accurate representation.

The penetration rates of the six Ports of Entry are discussed in this report, and further information can be found in Appendix C.

Crossing Time, Wait Time and Delay Calculations:

Crossing time and wait time can be measured using multiple ARID devices along border crossing segments. Crossing time, as it applies to this study, is defined as the time required for passenger vehicles to pass by the first ARID device, proceed through the check point, and pass by a second ARID device. Wait time describes a smaller component of crossing time, where the time is measured from the first ARID device to a second ARID device located at the border check point station. To accurately measure crossing time and wait time at a Port of Entry in both queuing directions using ARID technology, three device installation positions are required. The configuration of devices to determine wait time and crossing time are shown in Figure 2.

When ARID devices are permanently implemented at a Port of Entry, three devices should be installed to accurately measure both the crossing time and wait time in the entering and exiting U.S. directions.

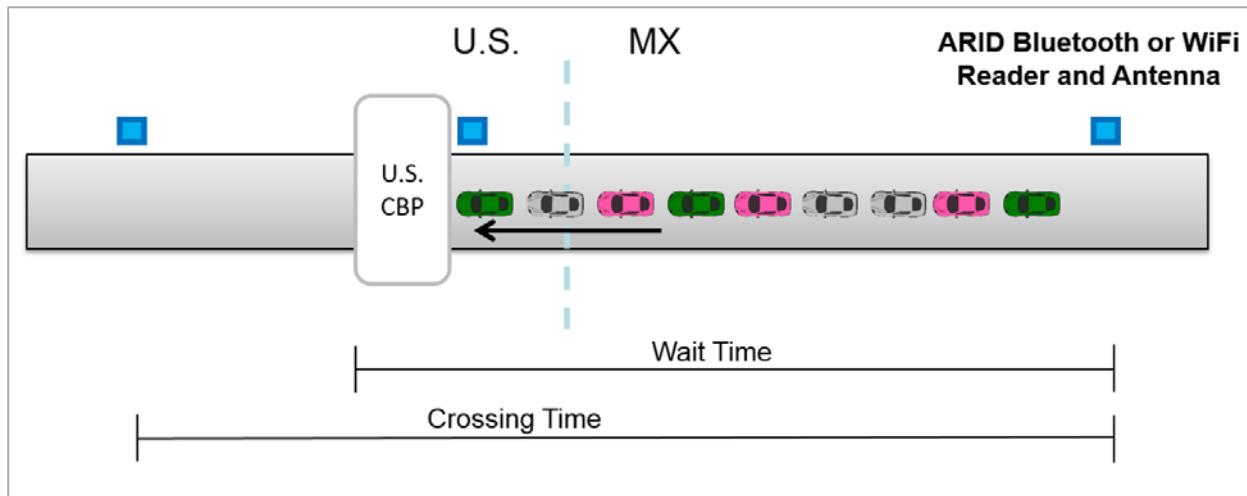

Figure 2: Wait Time and Crossing Time Diagram at a Port of Entry

The wait time, delay, and vehicle delay are estimated using the following formulae:

Wait Time (seconds) = Crossing Time (seconds) - time required at free flow condition from check point to downstream ARID device (seconds)

Delay (hours) = Wait Time (hours) – time required at free flow condition (hours)

Vehicle Delay (cars-hours) = Delay (hours) X Number of vehicles (cars)

SAN LUIS PORT OF ENTRY

The San Luis Port of Entry connects San Luis, Arizona with San Luis Rio Colorado, Sonora, and operates on a 24-hour basis, seven days a week. The primary access roadways to the POE are U.S. Route 95 (Arizona) Mexican Federal Highway 2 (Sonora), and Mexican Federal Highway 40 (Sonora). Figure 3 and Table 3 describe the study area, device deployment locations, and data collection segments at the San Luis POE.

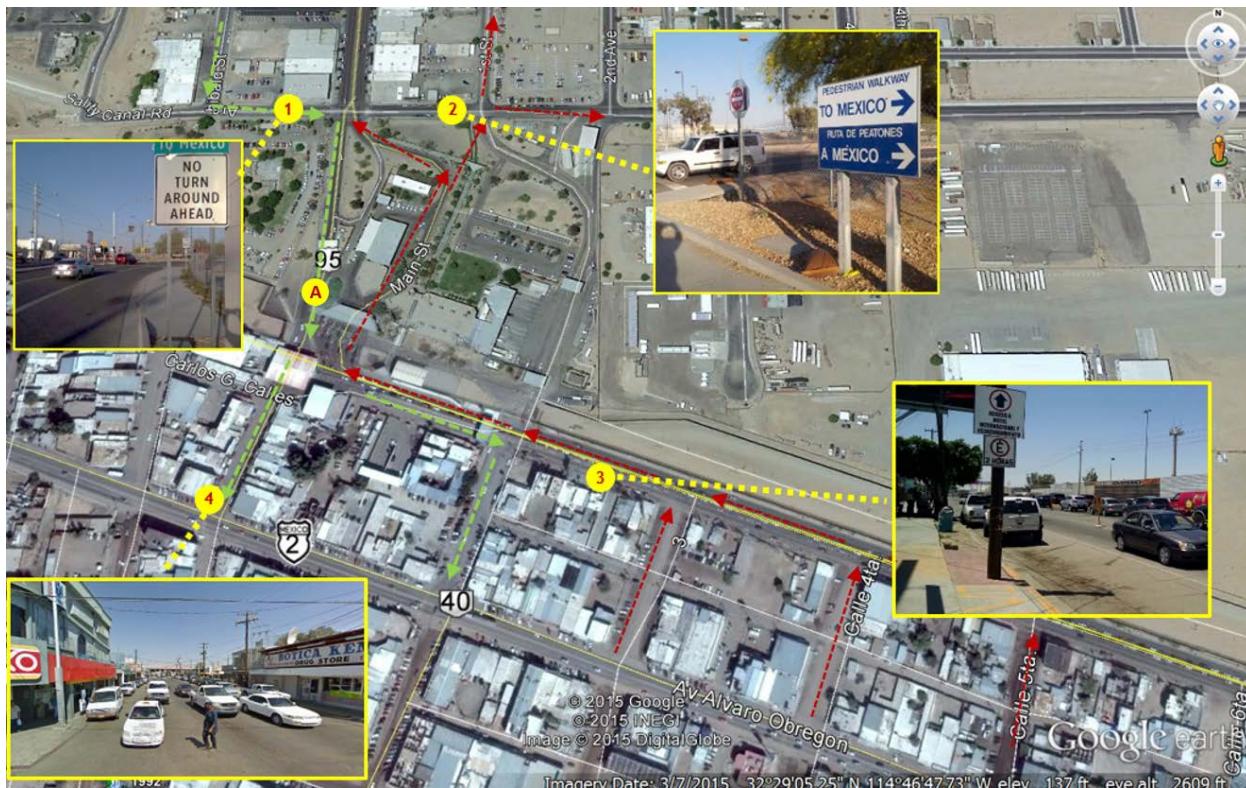

Figure 3. San Luis Port of Entry, Aerial View and Device Position Location

Four ARID devices were deployed at the San Luis Port of Entry: two located in Arizona (Positions 1 and 2), and two located in Sonora (Positions 3 and 4). Using this configuration, there are two northbound segments (3 to 1 and 3 to 2) and two southbound segments (1 to 3 and 1 to 4) available for Wi-Fi matching. A Miovision camera was deployed at Position A, with the ability to collect southbound traffic volume counts. The Miovision data collected from Position A relates to the ARID Wi-Fi data segment from Position 1 to 4, which was used to calculate the penetration rates.

Due to security concerns, the equipment at each location was taken down each day by 10:00 PM to ensure the security of the devices. Data was collected between the hours of 4:00 AM and 10:00 PM at this POE. A summary of the collected data is shown in Figure 4.

Table 3. San Luis Port of Entry, Data Collection Segment Information

| ARID Device Data Collection Locations | | |
|---|--|--|
| Position 1 | Mounted on ADOT signage located on the south side of Urtuzuastegui St. (west of State Route 95) | |
| Position 2 | Mounted on ADOT directional signage on Urtuzuastegui St. and intersection of northbound exit from San Luis POE. | |
| Position 3 | Mounted on utility pole south of Captain Carlos G. Calles (approach road for POE) in public space between Calle 2 and Calle 3. | |
| Position 4 | Device positioned in a parked vehicle in public space near the intersection of Calle 1/Calle Alvaro Obregon. | |
| Segments Evaluated Using ARID Technology | | |

San Luis Port of Entry

San Luis, Arizona / San Luis Rio Colorado, Sonora

ARID Wi-Fi Data Summary

Data Collected from July 2 - 4, 2015

| Northbound | MX to US (3-1) | Southbound | US to MX (1-3) |
|------------|---|------------|--|
| | Travel Time Samples Collected: Total Samples 2565 Hours Analyzed 39 Average Matches Per Hour 67 | | Travel Time Samples Collected: Total Samples 192 Hours Analyzed 26 Average Matches Per Hour 8 |
| Northbound | MX to US (3-2) | Southbound | US to MX (1-4) |
| | Travel Time Samples Collected: Total Samples 3150 Hours Analyzed 36 Average Matches Per Hour 89 | | Travel Time Samples Collected: Total Samples 3092 Hours Analyzed 26 Average Matches Per Hour 121 |

Miovision Video Data Summary

Data Collected from July 1 - 4, 2015

| Southbound | US to MX - At Position A, Reflecting (1-4) |
|------------|--|
| | Travel Time Samples Collected: Total Samples 23434 Hours Analyzed 62 Average Vehicles Per Hour 379 |

Note: The difference between ARID and Miovision Start/End dates is due to varied installation time and the omission of invalid data periods.

Figure 4. San Luis Port of Entry, Summary of ARID Wi-Fi and Miovision Data

The segments evaluated over the 3-4 day period show consistent quantities in Wi-Fi matches, with the exception of the southbound segment from Position 1 to 3. This is due to the one-way directional flow at Position 3.

Figure 5 shows the total personal vehicles observed at the San Luis POE in relation to the quantity of Wi-Fi matches. The multiple days of data are summarized into hourly averages over a 24-hour period. The moving line represents the penetration rate, which is the ratio between Wi-Fi matching and the total number of hourly vehicles.

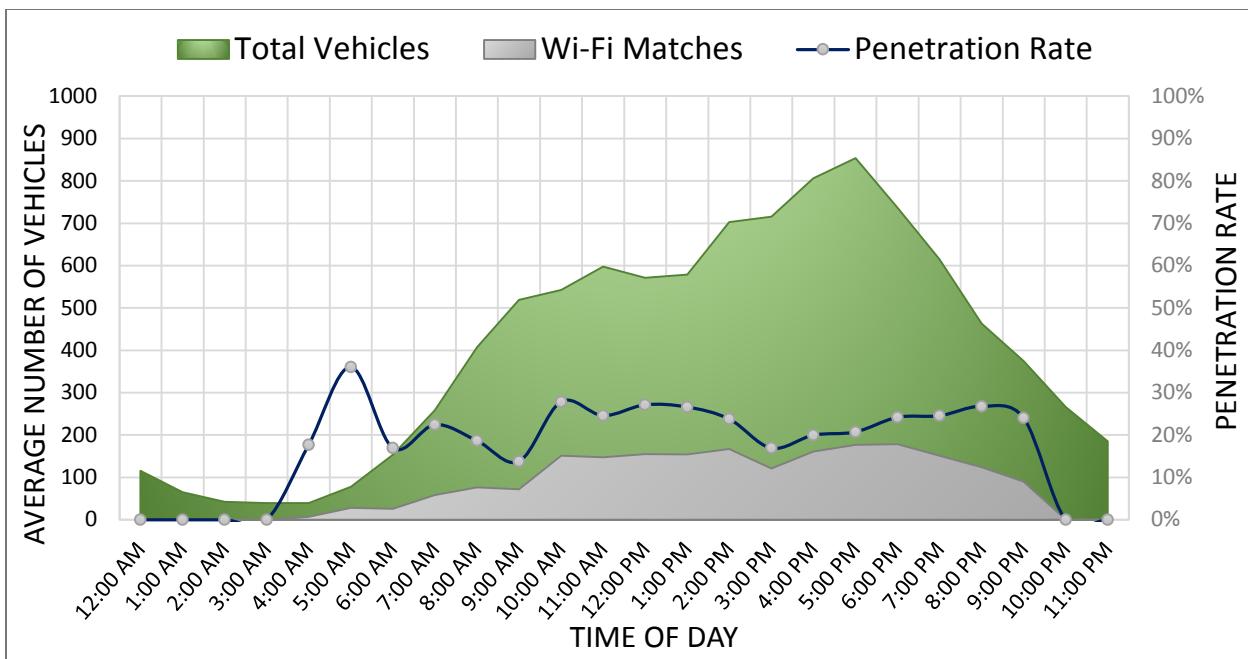

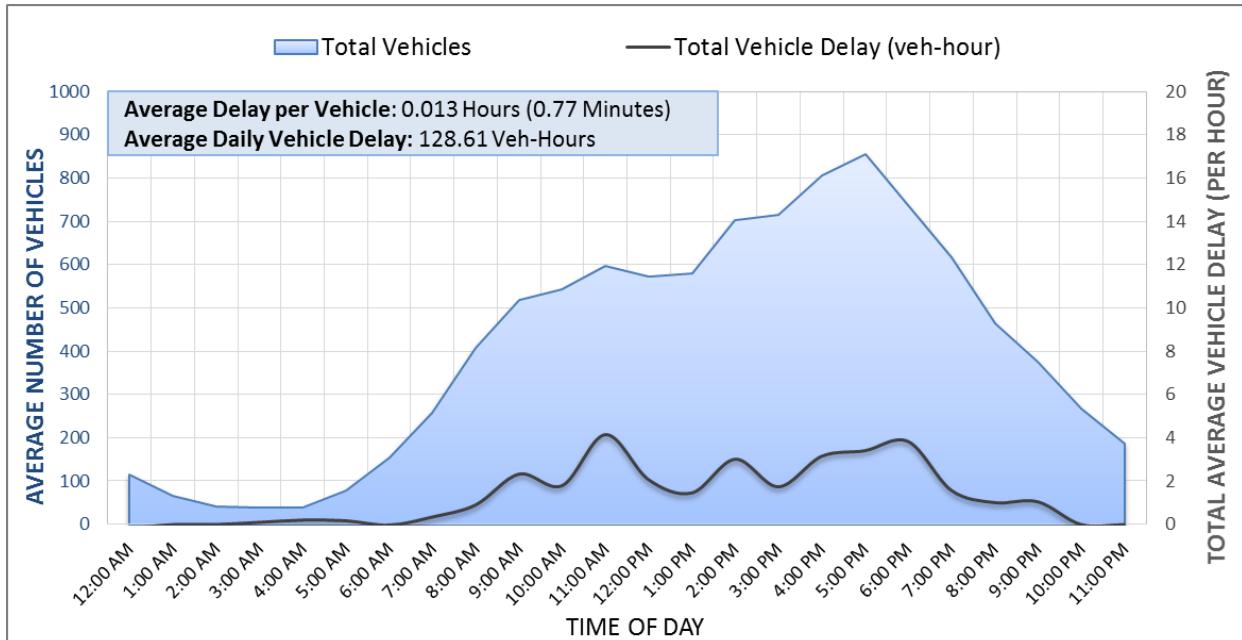

Figure 5. San Luis Port of Entry, Quantity of Total Vehicles and ARID Wi-Fi Matches Observed in the Southbound Direction (1-4)

The average daily penetration rate at the San Luis Port of Entry was determined to be 21.0% in the southbound direction.

At the San Luis Port of Entry, there was an average delay per vehicle of 0.77 minutes in the northbound direction.

Note: The scale is increased in the San Luis plots to include the larger datasets.

Figure 6. San Luis Port of Entry, Average Delay of Southbound Vehicles Exiting the U.S. (1-4)

LKEVILLE PORT OF ENTRY

The Lukeville Port of Entry connects Lukeville, Arizona with Sonoyta, Sonora. The Lukeville POE operates seven days a week between 6:00 AM and 12:00 AM. Arizona State Route 85 (North Ajo Sonoita Highway) in Arizona and Mexican Federal Highway 8 (Benemérito de Las Americas) in Sonora are the primary access roadways to the POE. The Lukeville POE study area and device position locations are displayed in Figure 7. Descriptions of the device locations and the data collection segments are provided in Table 4.

Figure 7. Lukeville Port of Entry, Aerial View and Device Position Location

Table 4. Lukeville Port of Entry, Data Collection Segment Information

| ARID Device Data Collection Locations | | |
|---|---|--------------------------------------|
| Position 1 | Located west of N Ajo Sonoita Highway (State Route 85) just north of the gas station. The device was mounted on a north-facing "Firearms" sign. | |
| Position 2 | Located on a light pole in the median between northbound and southbound lanes of State Route 85 (within the CBP facility). | |
| Segments Evaluated Using ARID Technology | | |
| SB | 1 → 2 | Lukeville, Arizona (US) → POE Border |
| NB | 2 → 1 | POE Border → Lukeville, Arizona (US) |
| Miovision Data Collection Location | | |
| Mounting Location: Position 1 | | |
| Segments Evaluated Using ARID Technology | | |
| SB | 1 → 2 | Lukeville, Arizona (US) → POE Border |

Two ARID devices were deployed at the Lukeville POE, one in Arizona (Position 1) and one at the border crossing (Position 2). The northbound and southbound segments between the two devices were observed using Wi-Fi matching. The Miovision camera was mounted at Position 1, which captured southbound volumes for comparison to the collected southbound ARID data segment.

The total volume and Wi-Fi match data was collected over a 3 day period. A summary of the data collection is shown in Figure 8.

Lukeville Port of Entry

Lukeville, Arizona / Sonoyta, Sonora

ARID Wi-Fi Data Summary

Data Collected from June 29 - July 1, 2015

| Northbound | POE to US (2-1) | Southbound | US to POE (1-2) |
|--|---|---------------------------------------|---|
| Travel Time Samples Collected: | | Travel Time Samples Collected: | |
| Total Samples | 1897 | Total Samples | 660 |
| Hours Analyzed | 38 | Hours Analyzed | 44 |
| Average Matches Per Hour | 50 | Average Matches Per Hour | 15 |
| Miovision Video Data Summary | | | <i>Note: The difference between ARID and Miovision Start/End dates is due to varied installation time and the omission of invalid data periods.</i> |
| Data Collected from June 30 - July 1, 2015 | | | |
| Southbound | US to POE - At Position 1, Reflecting (1-2) | | |
| Travel Time Samples Collected: | | | |
| Total Samples | 469 | | |
| Hours Analyzed | 26 | | |
| Average Vehicles Per Hour | 18 | | |

Figure 8. Lukeville Port of Entry, Summary of ARID Wi-Fi and Miovision Data

During the three day period, the quantity of Wi-Fi matches of vehicles travelling northbound (entering into Arizona) was more than three times greater than that of southbound Wi-Fi matches (exiting Arizona).

Figure 9 represents the comparison of total vehicles to the quantity of Wi-Fi matches observed in the southbound direction. The hourly Wi-Fi matches follow the trend of the total hourly traffic volume, however; due to the low traffic volume the penetration rate is more unstable. The lower sample size creates more variability in the data and the results more susceptible to the influence of error. The Wi-Fi matches have the potential to be skewed to reflect an inflated amount if vehicles carry multiple Wi-Fi devices, or if there is a significant volume of truck traffic. Total volume counts include personal vehicles only, but it is not possible to identify and remove Wi-Fi matches from non-personal vehicles.

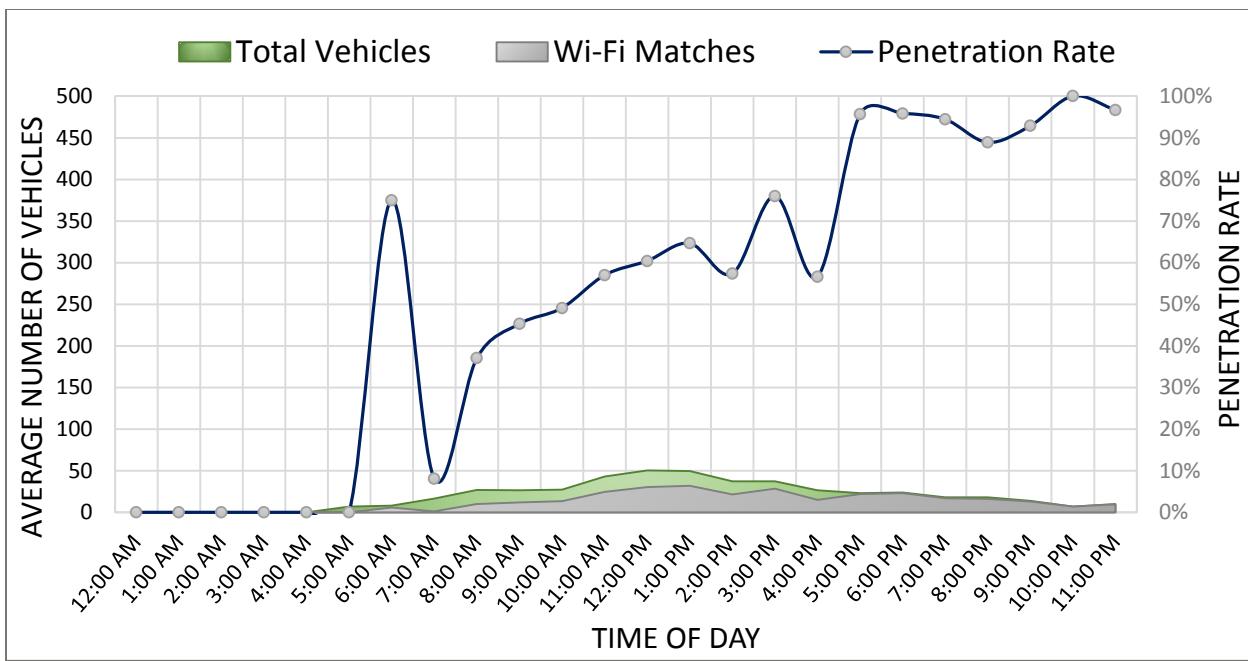

Figure 9. Lukeville Port of Entry, Quantity of Total Vehicles and ARID Wi-Fi Matches Observed in the Southbound Direction (1-2)

The average daily penetration rate was 64.2% in the southbound direction. As mentioned in Table 1, the total personal vehicle volume of the Lukeville and Naco Ports of Entry are significantly lower than the other four POEs. When comparing the effectiveness of the Wi-Fi devices at the six POEs, the penetration rates of the Lukeville and Naco POEs should be interpreted with caution due to their low volumes.

The average delay per vehicle was determined to be 0.52 minutes in the southbound direction, with a collective average vehicle delay of approximately 4 vehicle-hours per day.

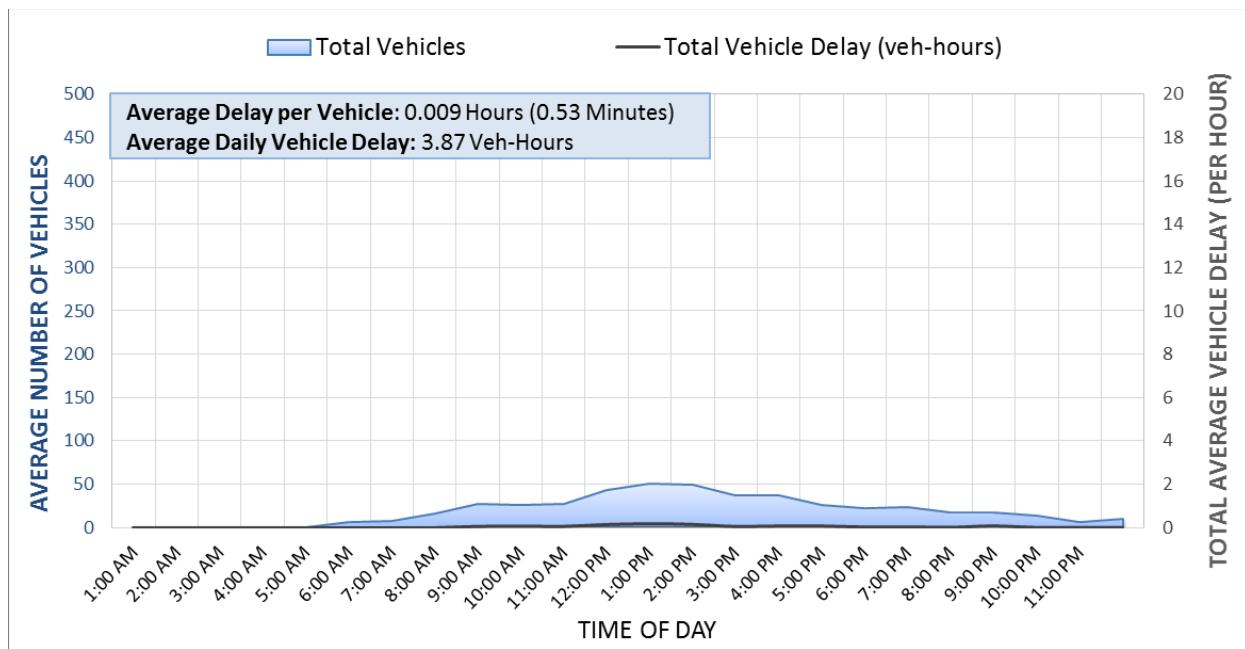

Figure 10. Lukeville Port of Entry, Average Delay of Southbound Vehicles Exiting the U.S. (1-2)

MARIPOSA PORT OF ENTRY

The Mariposa Port of Entry connects Nogales, Arizona with Nogales, Sonora. It operates seven days a week between 6:00 AM and 10:00 PM. State Route 189 (Mariposa Road) in Arizona and Mexican Federal Highway 15D in Sonora are the primary access roadways for the port of entry. Figure 11 and Table 5 describe the study area, device deployment locations, and data collection segments.

Figure 11. Mariposa Port of Entry, Aerial View and Device Position Location

Table 5. Mariposa Port of Entry, Data Collection Segment Information

| ARID Device Data Collection Locations | | |
|--|---|------------------------------------|
| Position 1 | Mounted to the ADOT pedestrian median structure located on N. Mariposa Rd., just south of the N. Mariposa Rd/Freeport Dr. intersection. | |
| Position 2 | Mounted to the light pole immediately south of the northbound lane signage on the approach to Mariposa POE. | |
| Position 3 | Device positioned in a parked vehicle located along Periferico Pte. | |
| Segments Evaluated Using ARID Technology | | |
| SB | 1 → 2 | Nogales, Arizona (US) → POE Border |
| NB | 2 → 1 | POE Border → Nogales, Arizona (US) |
| SB | 2 → 3 | POE Border → Nogales, Sonora (MX) |
| NB | 3 → 2 | Nogales, Sonora (MX) → POE Border |
| Miovision Data Collection Location | | |
| Mounting Location: Position 1 | | |
| Segments Evaluated Using Miovision Technology | | |
| SB | 1 → 2 | Nogales, Arizona (US) → POE Border |
| NB | 2 → 1 | POE Border → Nogales, Arizona (US) |

Three ARID devices were deployed at the Mariposa Port of Entry: one located in Arizona (Position 1), one located at the border (Position 2), and one located in Sonora (Position 3). Using this configuration, Wi-Fi matching was possible along the northbound and southbound segments between Positions 1 and 2 and between Positions 2 and 3. The Miovision camera was installed at Position 1, with the ability to record traffic volume counts in the northbound and southbound directions. Due to security concerns during non-operational hours, the equipment at each location was taken down each day between 8:00 PM and 9:00 PM to ensure the security of the devices prior to the nightly POE closure. Data was collected between the hours of 6:00 AM and 8:00 PM.

A summary of the collected data is shown in Figure 12.

Mariposa Port of Entry

Nogales, Arizona / Nogales, Sonora

ARID Wi-Fi Data Summary

Data Collected from June 16 - 18, 2015

| POE to US (2-1) | | US to POE (1-2) | |
|---------------------------------------|--------------------------|---------------------------------------|--------------------------|
| Travel Time Samples Collected: | | Travel Time Samples Collected: | |

Figure 12. Mariposa Port of Entry, Summary of ARID Wi-Fi and Miovision Data

During the three-day data collection period, both the Miovision and ARID technologies indicated greater traffic volumes in the northbound direction (vehicles entering Arizona). A high traffic volume counts were observed using the Miovision cameras, however the levels of Wi-Fi detection were relatively low. This corresponds to low penetration rates, which is shown in Figures 13 and 14.

The average daily penetration rate at the Mariposa Port of Entry was determined to be 5.7% in the northbound direction and 2.4% in the southbound direction.

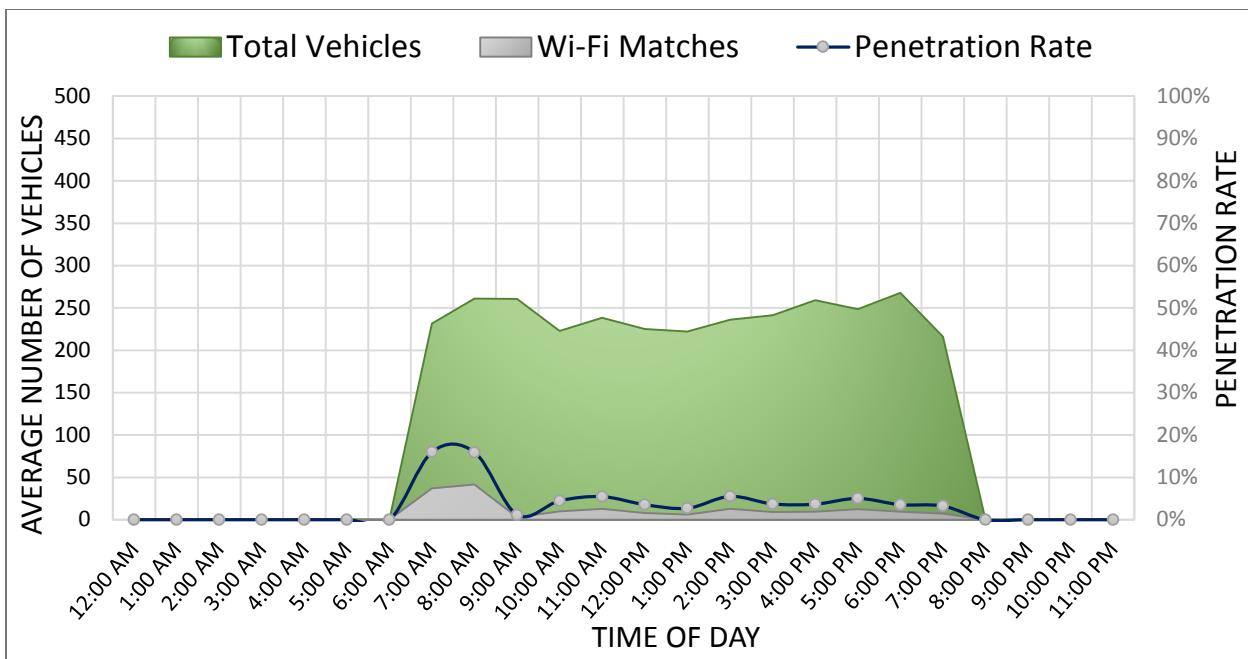

Figure 13. Mariposa Port of Entry, Quantity of Total Vehicles and ARID Wi-Fi Matches Observed in the Northbound Direction (2-1)

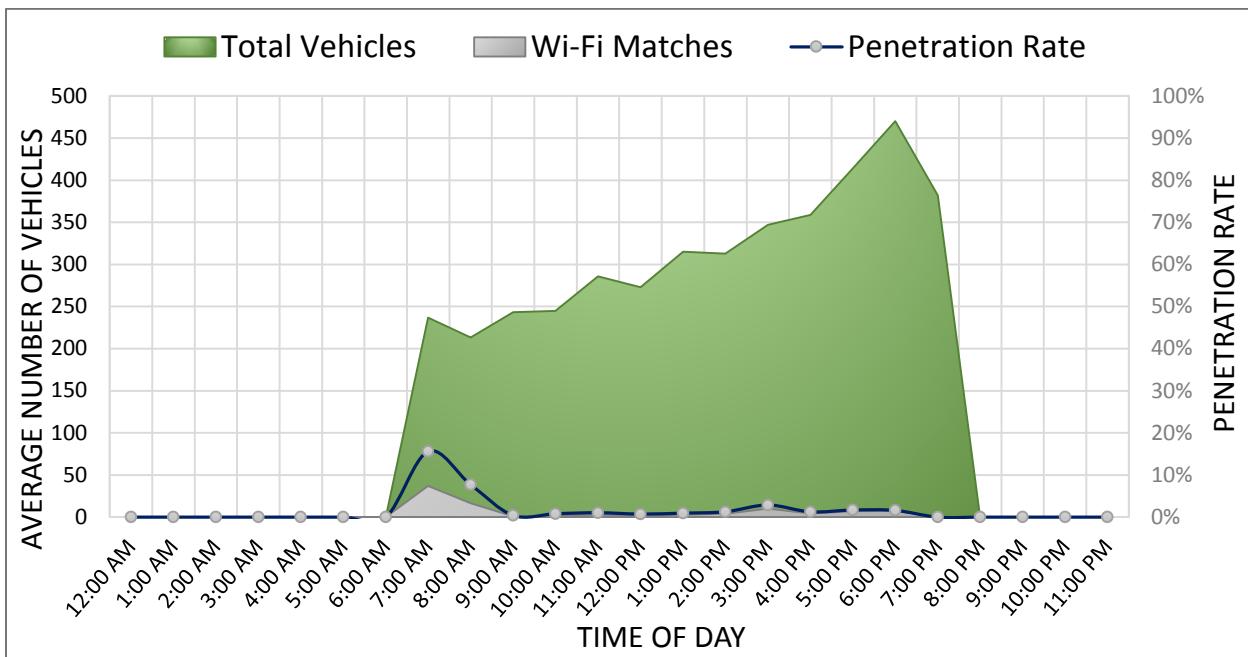

Figure 14. Mariposa Port of Entry, Quantity of Total Vehicles and ARID Wi-Fi Matches Observed in the Southbound Direction (1-2)

In the northbound direction, the average delay per vehicle was 5.46 minutes, with an average daily vehicle delay of approximately 240 vehicle-hours. In the southbound direction, the average delay per vehicle was 0.96 minutes, with 42 vehicle-hours of average daily vehicle delay.

DECONCINI PORT OF ENTRY

The DeConcini Port of Entry connects Nogales, Arizona with Nogales, Sonora, and operates on a 24-hour basis, seven days a week. The primary access roadways to the POE are Interstate 19 Business (Grand Avenue) in Arizona and Mexican Federal Highway 15 in Sonora. Figure 17 and Table 6 describe the study area, device deployment locations, and data collection segments.

Figure 17. DeConcini Port of Entry, Aerial View and Device Position Location

Table 6. DeConcini Port of Entry, Data Collection Segment Information

| ARID Device Data Collection Locations | | |
|--|--|--|
| Position 1 | Mounted on ADOT sign structure southeast of the intersection of Grand Ave and Park. | |
| Position 3 | Located in the INDAABIN managed median "flag park" between the northbound and southbound lanes of Adolfo Lopez Mateos. | |
| Segments Evaluated Using ARID Technology | | |
| SB | 1 → 3 | Nogales, Arizona (US) → Nogales, Sonora (MX) |
| NB | 3 → 1 | Nogales, Sonora (MX) → Nogales, Arizona (US) |
| Miovision Data Collection Location | | |

| SB | 1 → 3 | Nogales, Arizona (US) → Nogales, Sonora (MX) |
| NB | 3 → 1 | Nogales, Sonora (MX) → Nogales, Arizona (US) |

Two ARID devices were deployed at the DeConcini POE. An ARID device and Miovision camera were installed in Arizona (Position 1) and a second ARID device was installed in Sonora (Position 3). Total traffic volume counts and Wi-Fi matches were collected for the northbound and southbound segments between the Arizona and Sonora device locations. A summary of the collected data is shown in Figure 18.

Figure 18. DeConcini Port of Entry, Summary of ARID Wi-Fi and Miovision Data

During the three-day data collection period, both the Miovision and ARID technologies indicated greater traffic volumes in the northbound direction (vehicles entering Arizona). The penetration rate was also greater in the northbound direction. Figures 19 and 20 describe the relationship between the total number of vehicles and the quantity of vehicles detected by Wi-Fi matching at the DeConcini Port of Entry.

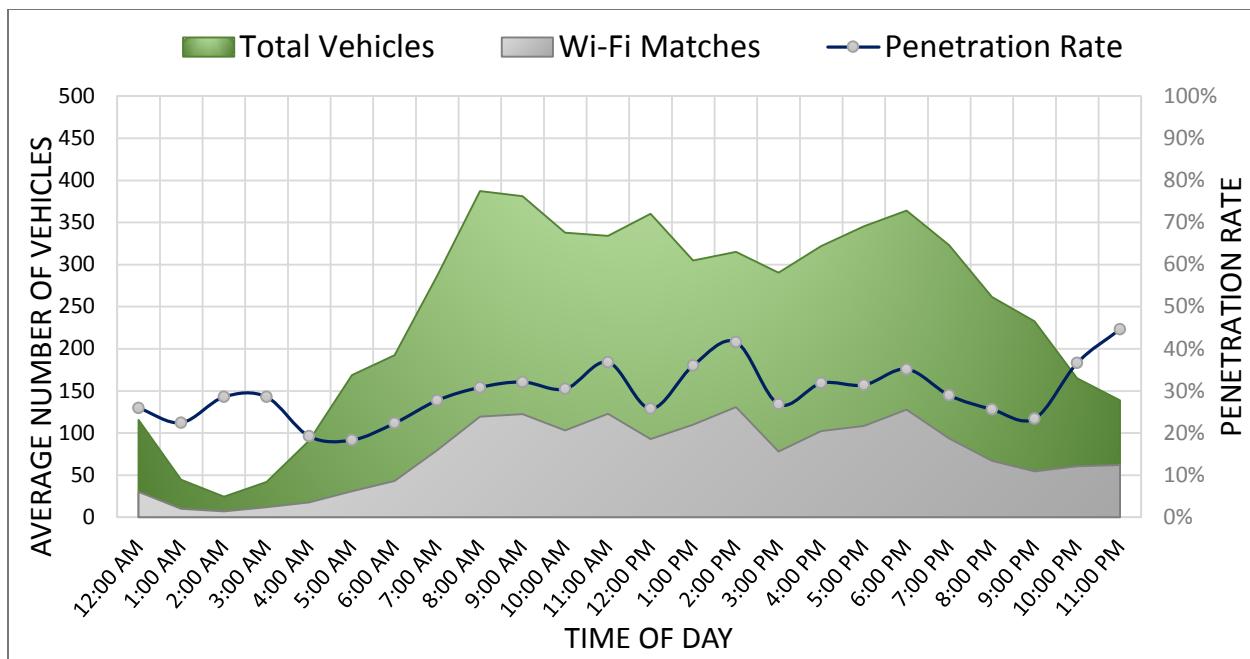

Figure 19. DeConcini Port of Entry, Quantity of Total Vehicles and ARID Wi-Fi Matches Observed in the Northbound Direction (3-1)

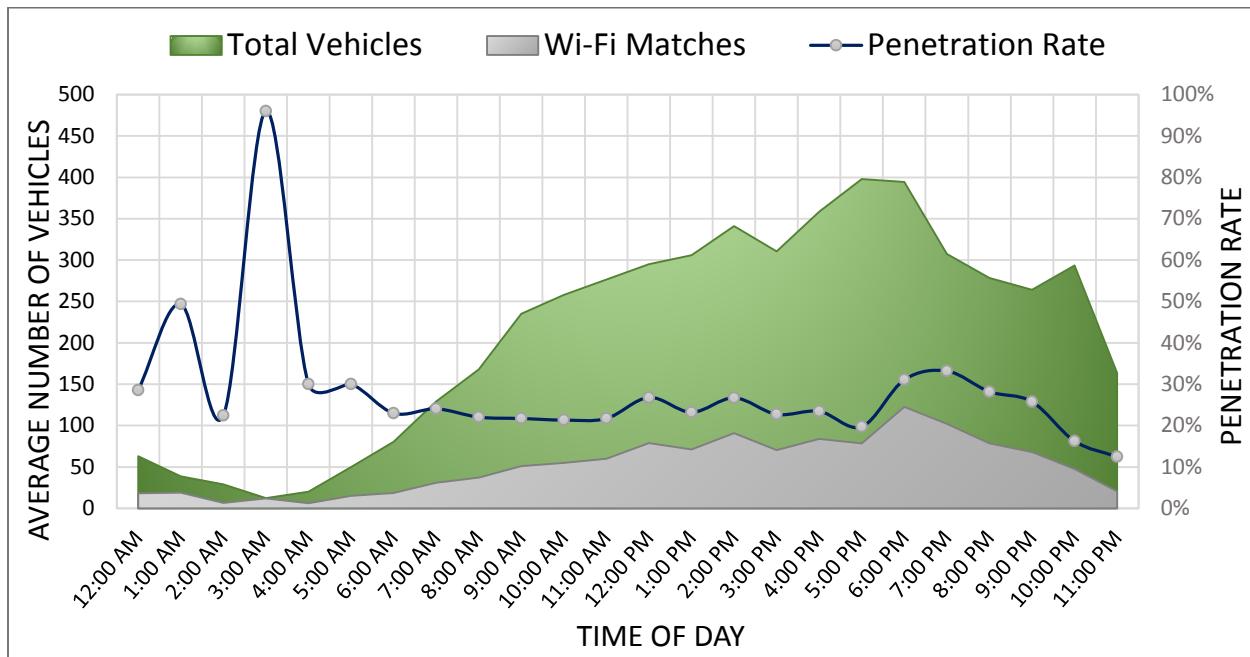

Figure 20. DeConcini Port of Entry, Quantity of Total Vehicles and ARID Wi-Fi Matches Observed in the Southbound Direction (1-3)

In both the northbound and southbound directions, the Wi-Fi matches follow the same moving trends as the total hourly vehicle volume averages. These findings indicate that the equipment operated successfully and consistent vehicle samples were evaluated in the analysis (same

location, days, time periods, etc.) The average daily penetration rate was determined to be 30.6% in the northbound direction and 24.5% in the southbound direction.

The average delay per vehicle in the northbound and southbound directions was 2.89 minutes and 0.78 minutes, respectively. The collective average vehicle delay was 303 vehicle-hours per day and 70 vehicle-hours per day, in the northbound and southbound directions, respectively.

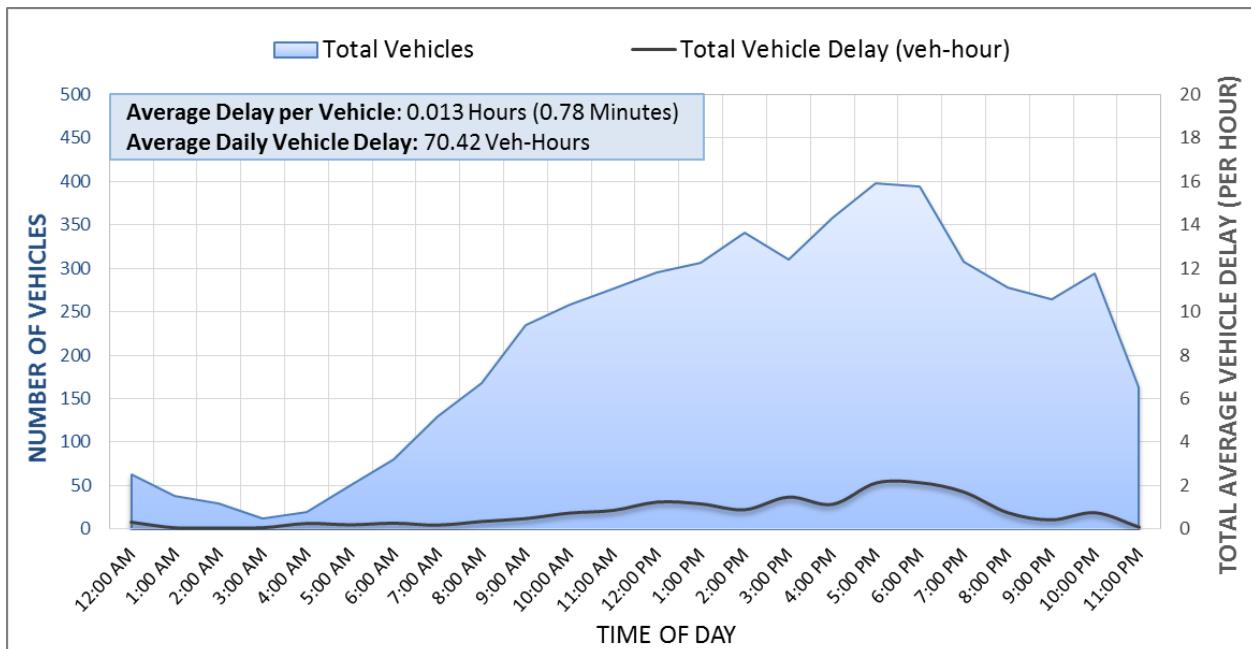

Figure 22. DeConcini Port of Entry, Average Delay of Southbound Vehicles Exiting the U.S. (1-3)

NACO PORT OF ENTRY

The Naco Port of Entry connects Naco, Arizona to Naco, Sonora. The Naco POE operates seven days a week on a 24-hour basis. The primary access roadways to the POE are the Naco Highway in Arizona and the Mexican Federal Highway 2 in Sonora. The Naco study area and device position locations are shown in Figure 23, and descriptions of the device locations and the data collection segments are provided in Table 7.

Figure 23. Naco Port of Entry, Aerial View and Device Position Location

Table 7. Naco Port of Entry, Data Collection Segment Information

| ARID Device Data Collection Locations | | |
|---|---|---------------------------------|
| Position 1 | Located south of Naco Highway, east on the intersection of International Rd./Naco Highway. The device is mounted on a fence post of the CBP Commercial Inspection Facility. | |

| | | | |

Note: The difference between ARID and Miovision Start/End dates is due to varied installation time and the omission of invalid data periods.

Figure 24. Naco Port of Entry, Summary of ARID Wi-Fi and Miovision Data

Data at the Naco POE was collected over a two-day period, which occurred on a Friday and Saturday. Both Miovision video count data and Wi-Fi match data indicate greater volumes on the southbound segment (vehicles exiting Arizona). The amount of Wi-Fi matches made in the northbound and southbound segments are similar, however there is a much greater total volume observed using Miovision cameras in the southbound than the northbound direction. This difference in Wi-Fi detection is shown in the hourly average penetration rate of Figures 25 and 16.

The average daily penetration rates were 53.5% and 27.8% in the northbound and southbound directions, respectively. When comparing the effectiveness of the Wi-Fi devices at the six POEs, the penetration rates of the Lukeville and Naco POEs should be interpreted with caution due to their low volumes.

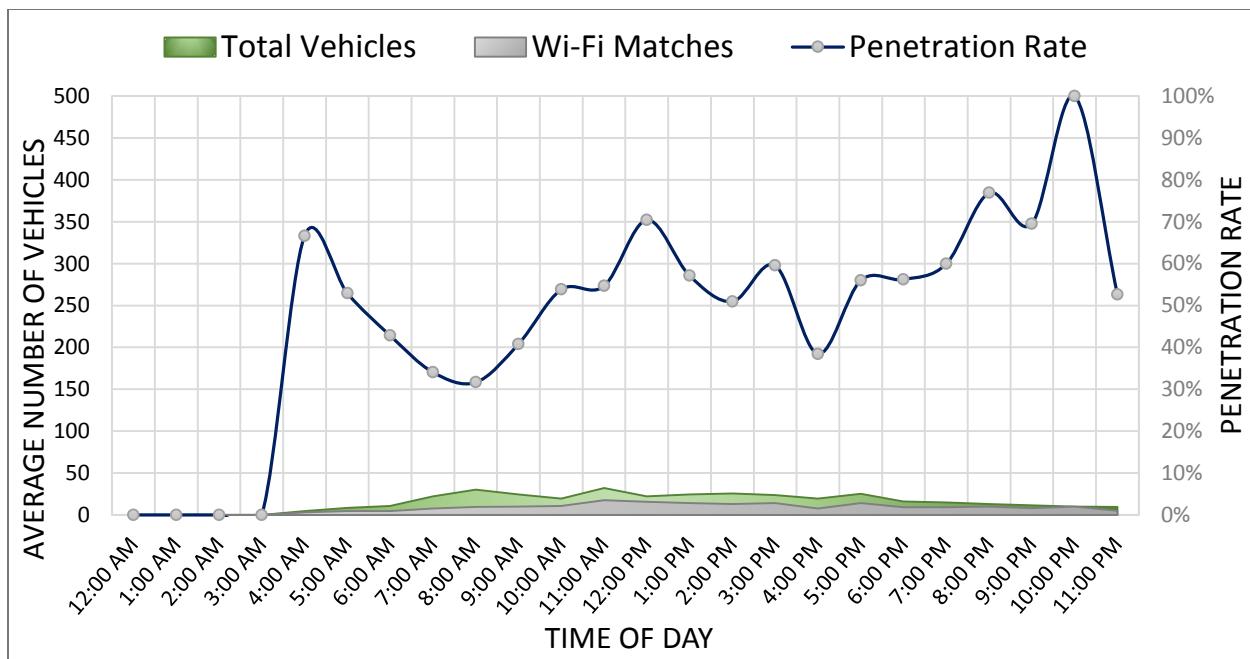

Figure 25. Naco Port of Entry, Quantity of Total Vehicles and ARID Wi-Fi Matches Observed in the Northbound Direction (2-1)

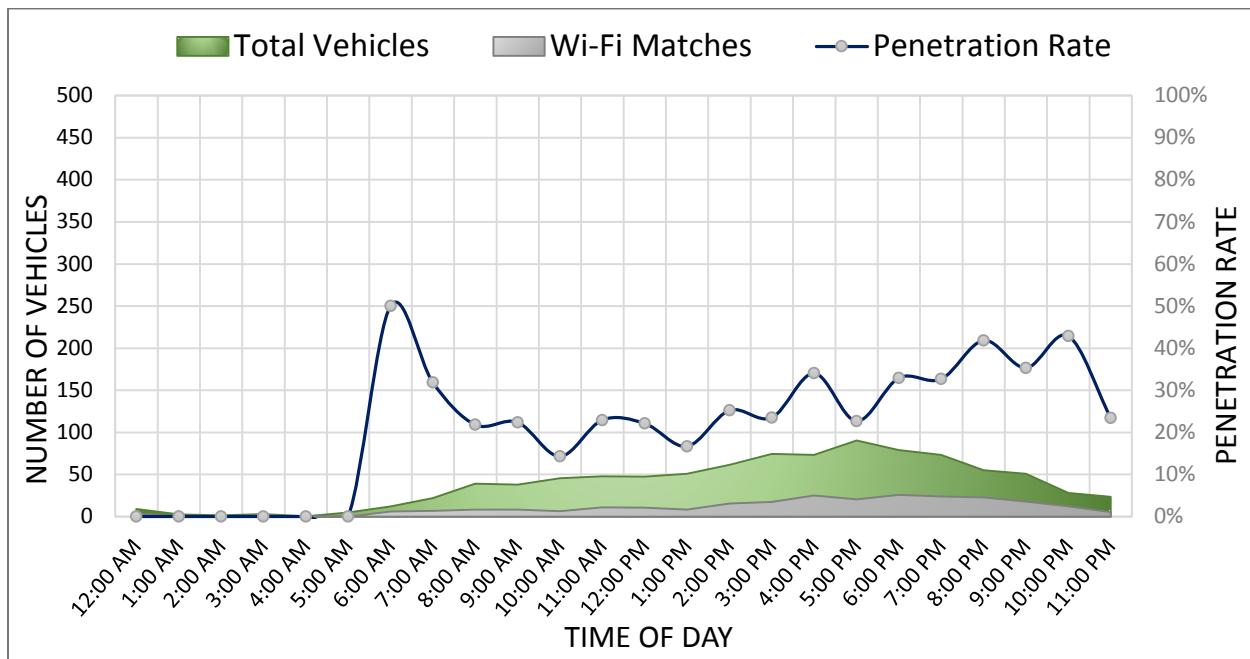

Figure 26. Naco Port of Entry, Quantity of Total Vehicles and ARID Wi-Fi Matches Observed in the Southbound Direction (1-2)

The average delay per vehicle was found to be 0.72 minutes in the northbound direction and 0.28 minutes in the southbound direction. If all personal vehicles are considered, the average daily vehicle delay was approximately 5 and 4 vehicle-hours, respectively.

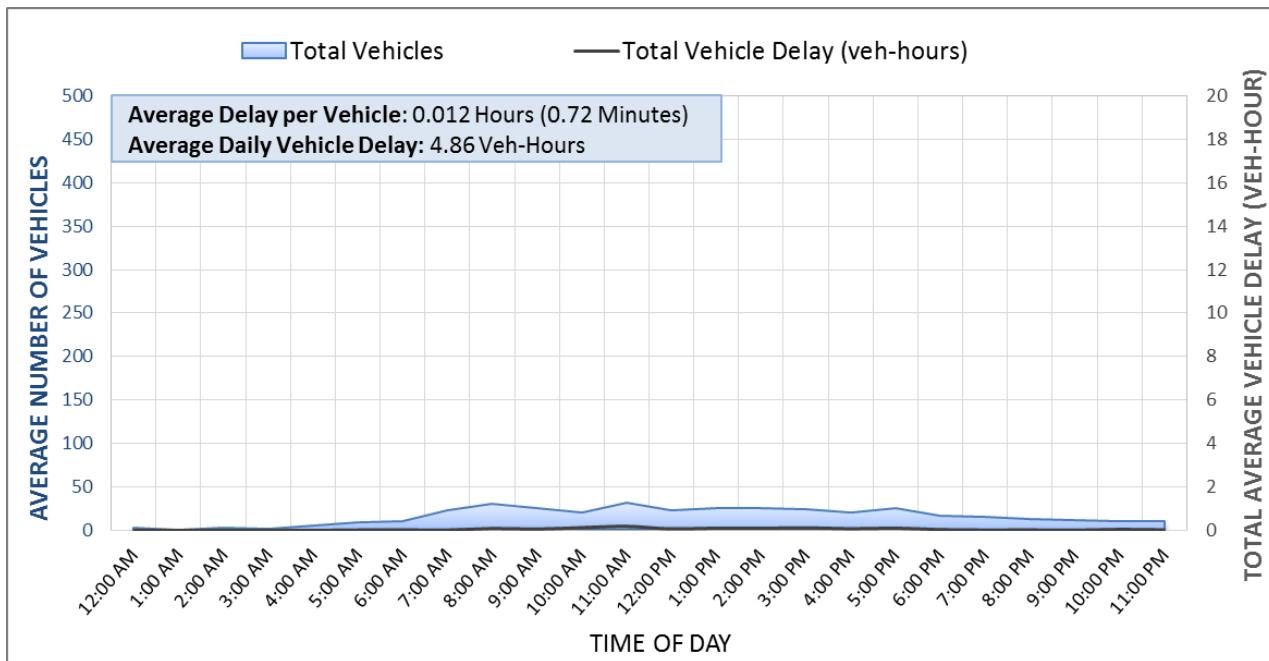

Figure 27. Naco Port of Entry, Average Delay of Northbound Vehicles Entering the U.S. (2-1)

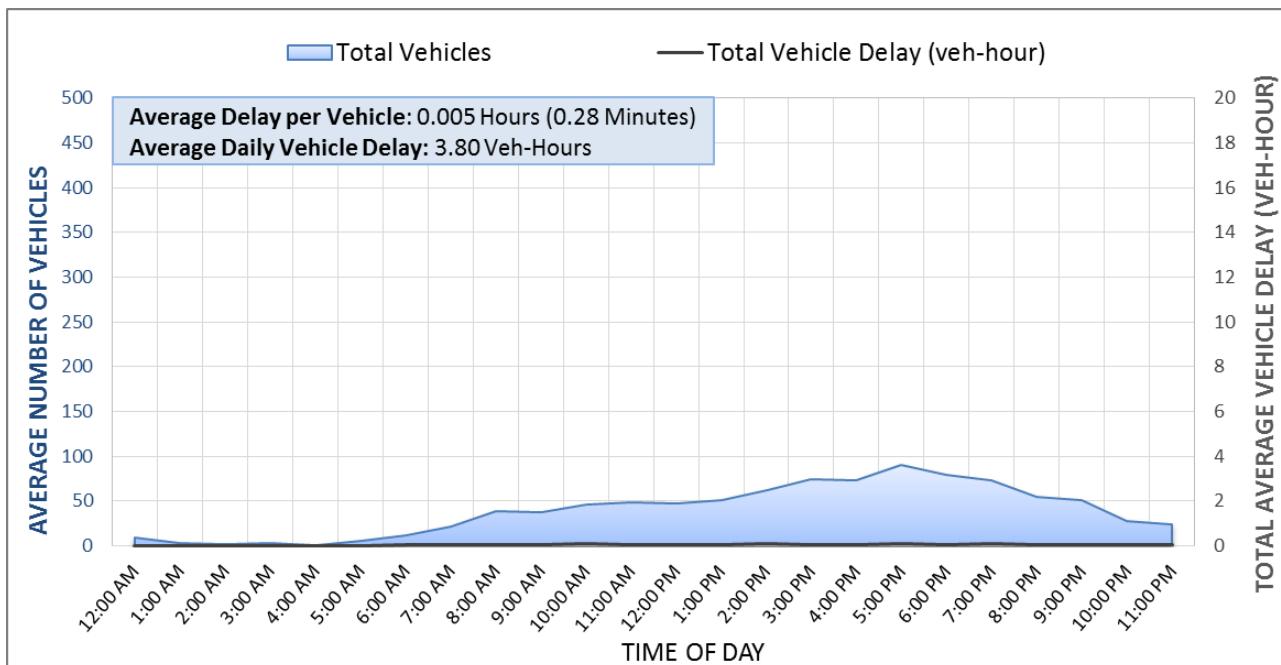

Figure 28. Naco Port of Entry, Average Delay of Southbound Vehicles Exiting the U.S. (1-2)

RAUL HECTOR CASTRO / DOUGLAS PORT OF ENTRY

The Raul Hector Castro Port of Entry connects Douglas, Arizona with Agua Prieta, Sonora. The Raul Hector Castro POE operates on a 24 hour basis, seven days a week. U.S. Route 191 Business (Pan American Avenue) in Arizona and Avenue 6 in Sonora are the primary access roadways to the POE. The POE study area and device position locations are shown in Figure 29, with detailed information of the travel time segments and positioning provided in Table 8.

Figure 29. Raul Hector Castro Port of Entry, Aerial View and Device Position Location

Table 8. Raul Hector Castro Port of Entry, Data Collection Segment Information

| ARID Device Data Collection Locations | | |
|--|--|----------------------------------|
| Position 1 | Intersection of Pan American Avenue (US 191) and 3rd Street. Device mounted to the ADOT tubular sign structure on Pan American Avenue. | |
| Position 2 | Device mounted on light pole located in the median immediately south of Customs and Border Protection and in between the Douglas POE SENTRI lane and southbound traffic. | |
| Position 3 | Device located in a parked vehicle along Calle Internacional. | |
| Segments Evaluated Using ARID Technology | | |
| SB | 1 → 2 | Douglas, Arizona → POE Border |
| NB | 2 → 1 | POE Border → Douglas, Arizona |
| SB | 2 → 3 | POE Border → Agua Prieta, Sonora |
| NB | 3 → 2 | Agua Prieta, Sonora → POE Border |
| Miovision Data Collection Location | | |
| Mounting Location: Position 1 | | |
| Segments Evaluated Using Miovision Technology | | |
| SB | 1 → 2 | Douglas, Arizona → POE Border |
| NB | 2 → 1 | POE Border → Douglas, Arizona |

Three ARID devices were deployed at this POE, one in Arizona (Position 1), one at the border crossing (Position 2), and one in Sonora (Position 3). Four individual segments were observed using Wi-Fi matching: the northbound and southbound segments connecting Arizona to the POE, and the northbound and southbound segments connecting the POE to Sonora. The Miovision video camera, which collected the traffic counts, was positioned on the Arizona side of the border (Position 1). The comparative analysis between the total number of vehicles and the quantity of Wi-Fi matches was conducted on the northbound and southbound segments between the Arizona device location and the border.

A substantial amount of traffic was observed during the 3-4 day data collection period. A summary of the total volume and the Wi-Fi match data at the Raul Hector Castro POE is shown in Figure 30.

Figure 30. Raul Hector Castro Port of Entry, Summary of ARID Wi-Fi and Miovision Data

The low amount of ARID Wi-Fi matches on the southbound segment from the border to the Agua Prieta, Sonora device location (2-3) is low due to the one-way, northbound-only directional flow on Calle Internacional. The 195 matches are assumed to be due to vehicles travelling parallel to Calle Internacional on the street below, Calle 1. These vehicle matches, although not directly on Calle Internacional, are considered to be valid in terms of travel time.

Figures 31 and 32 show the total personal vehicles observed at the Raul Hector Castro POE in relation to the quantity of Wi-Fi matches.

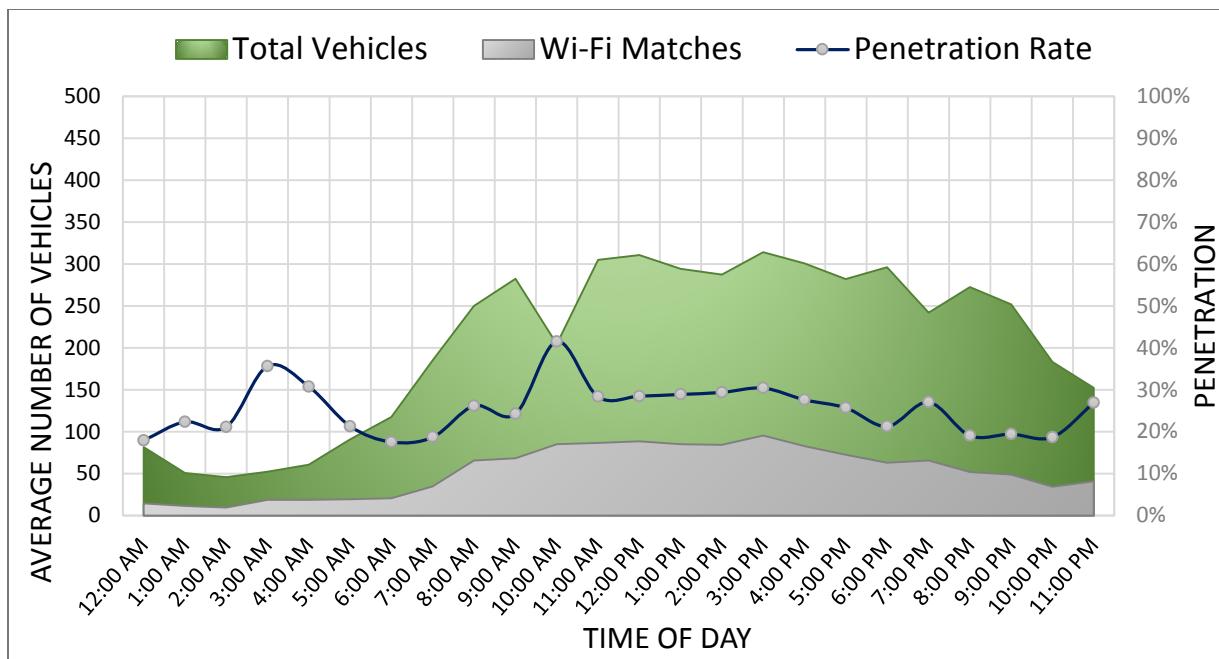

Figure 31. Raul Hector Castro Port of Entry, Quantity of Total Vehicles and ARID Wi-Fi Matches Observed in the Northbound Direction (2-1)

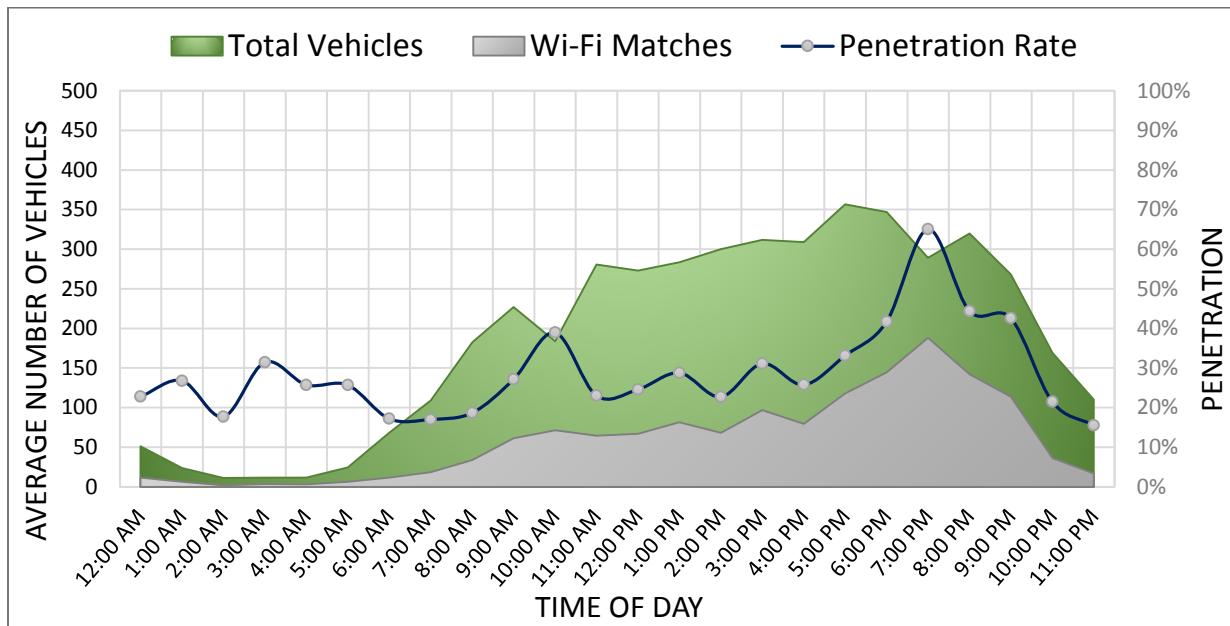

Figure 32. Raul Hector Castro Port of Entry, Quantity of Total Vehicles and ARID Wi-Fi Matches Observed in the Southbound Direction (1-2)

As shown in Figures 33 and 34, the quantity of hourly Wi-Fi matches follow the moving average of the total vehicle volume, which indicates that the equipment operated successfully and consistent vehicle samples were evaluated in the analysis (same location, days, time periods,

etc.) The average daily penetration rate was determined to be 25.8% in the northbound direction and 32.0% in the southbound direction.

The average delay per vehicle was determined to be 6.25 minutes in the northbound direction, and 1.75 minutes in the southbound direction. Incorporating the average number of vehicles per day, it was determined that the collective average vehicle delay was approximately 700 vehicle-hours per day in the northbound direction, and 200 vehicle-hours per day in the southbound direction.

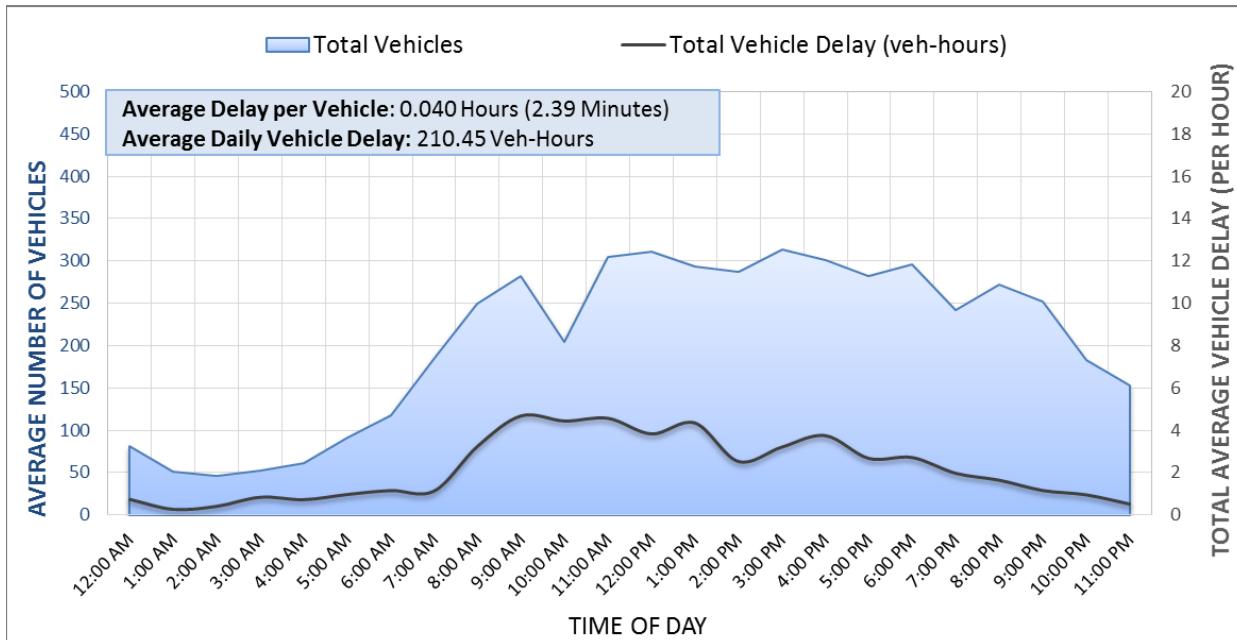

Figure 33. Raul Hector Castro Port of Entry, Average Delay of Northbound Vehicles Entering the U.S. (2-1)

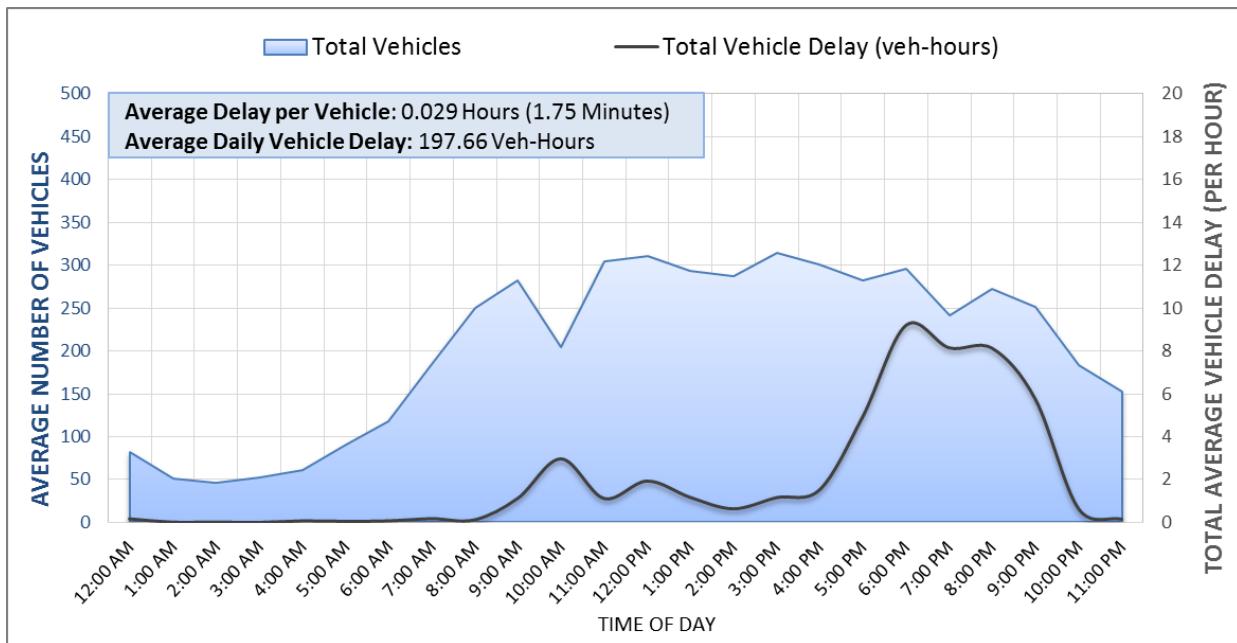

Figure 34. Raul Hector Castro Port of Entry, Average Delay of Southbound Vehicles Exiting the U.S. (1-2)

AVERAGE DAILY VEHICLE DELAY

The average daily vehicle delay (ADVD) is a measure that considers wait time, delay, and total quantity of vehicles. The ADVD is the sum of delay experienced by the average number of personal vehicles observed at each Port of Entry as part of this study.

The results of the ADVD analysis is consistent with average delay per vehicle trends. In all cases, the delay experienced by vehicles waiting to enter the U.S. is greater than those exiting the U.S. Naco and Lukeville POEs have the lowest volumes of the Ports of Entry, and they also have the lowest average delay per vehicle.

Table 9. Port of Entry Vehicle Delay Summary

| | Port of Entry | Average Vehicle Waiting Time (seconds) | Segment Length (mi) | Average Speed (mph) | Average Delay Per Vehicle (Minutes) | Average Delay Per Vehicle (Hours) | Average Daily Vehicle Delay (Veh-Hours) |
|---------------------------|---------------|--|---------------------|---------------------|-------------------------------------|-----------------------------------|---|
| San Luis | Exiting U.S. | 174 | 0.25 | 5.0 | 0.77 | 0.013 | 128.6 |
| DeConcini | Entering U.S. | 340 | 0.18 | 2.0 | 2.89 | 0.048 | 303.0 |
| | Exiting U.S. | 168 | 0.18 | 4.0 | 0.78 | 0.013 | 70.4 |
| Mariposa | Entering U.S. | 610 | 0.33 | 2.0 | 5.46 | 0.091 | 238.2 |
| | Exiting U.S. | 114 | 0.35 | 11.0 | 0.96 | 0.016 | 42.0 |
| Raul Hector Castro | Entering U.S. | 229 | 0.20 | 3.0 | 2.39 | 0.040 | 209.1 |

Note: Data shown is representative of days sampled as part of this study only

VALIDITY OF ARID WI-FI DEVICES FOR MEASURING TRAVEL TIME AT POEs

In order to evaluate the effectiveness and validity of installing permanent ARID Wi-Fi devices, it is important to understand the variability in the collected travel time data of each port of entry. POEs with adequate capacity and free flow traffic will have less travel time variability than other POEs with constricted traffic and “stop and go” delays. The required sample size is the amount of vehicles needed during a specified period to accurately represent the travel time of passenger vehicles. Table 10 lists each POE with its corresponding sample size requirements. POEs with a higher vehicle sample size requirement indicate that there is a greater amount of variability in the travel time, and a larger set of data is required to increase the confidence of the estimated travel time.

The three hour time period used in the sample size requirement analysis was determined based on the average peak period of the ports of entry. Naco POE Southbound and San Luis POE Northbound were adjusted to fit a more accurate representation of their peak periods.

The statistical analysis to measure the validity and required vehicle sample size was conducted using the following concept, and calculated using Statistica software:

$$\text{Sample Size} = \left(\frac{\text{Standard Deviation}}{\text{Standard Error}} \right)^2$$

Table 10. Port of Entry Vehicle Sample Size Requirements

| Port-of-Entry | Travel Direction | Time of Day Data Used | Sample Size Required | | Observed Vehicles (Wi-Fi) | | Observation Vehicles Sufficient? |
|--------------------|------------------|-----------------------|----------------------|-------------|---------------------------|-------------|----------------------------------|
| | | | 3-Hr Period | 1-Hr Period | 3-Hr Period | 1-Hr Period | |
| Raul Hector Castro | NB | 12 pm - 3 pm | 127 | 43 | 325 | 134 | YES |
| | SB | 12 pm - 3 pm | 4 | 2 | 217 | 82 | YES |
| Mariposa | NB | 12 pm - 3 pm | 88 | 30 | 28 | 14 | NO |
| | SB | 12 pm - 3 pm | 1 | 1 | 9 | 6 | YES |
| Naco | NB | 12 pm - 3 pm | 8 | 3 | 43 | 18 | YES |
| | SB | 4 pm - 7 pm | 1 | 1 | 71 | 30 | YES |
| DeConcini | NB | 12 pm - 3 pm | 140 | 47 | 333 | 130 | YES |
| | SB | 12 pm - 3 pm | 90 | 30 | 239 | 99 | YES |
| Lukeville | NB | 12 pm - 3 pm | 42 | 14 | 312 | 127 | YES |
| | SB | 12 pm - 3 pm | 9 | 3 | 75 | 33 | YES |
| San Luis | NB | 6 am - 9 am | 117 | 39 | 229 | 85 | YES |
| | SB | 12 pm - 3 pm | 6 | 2 | 448 | 167 | YES |

The ARID data at all POEs met the minimum required sample size, with the exception of the Mariposa POE in the northbound direction. This is due to low penetration rates at the Mariposa POE, which may have been related to deployment location or technology interference.

If the minimum sample size is not met, the data from that time period is not suitable for accurately representing the travel time. This data should be excluded from calculation to ensure the results are not skewed.

After permanent implementation of the ARID devices, continual calculation of the minimum sample size required is not necessary. The purpose of the sample size analysis was to provide an additional measure of confidence for this study to demonstrate that ARID technology can collect accurate data.

PERMANENT INSTALLATION OF ARID DEVICES FOR MEASURING TRAVEL TIME AT POES

The prioritization of ARID devices at the Ports of Entry is based on the volume of personal vehicles, the success of the ARID data collection, the average delay, and possible implementation constraints. The quantity of personal vehicles at each Port of Entry is described in Table 1, also in combination with vehicle delay in the average annual vehicle delay. The success of the ARID data collection is reflected in the penetration rate, or the percentage of total vehicles that are identified using Wi-Fi matching. A summary of the penetration rate results are provided in Table 11. The penetration results should be interpreted with caution, and the sample size should be considered. The unusually large penetration rates at the Lukeville and Naco Ports of Entry are due to the low volumes at these locations. The lower the sample size is, the greater the risk of inaccurate results. Bias can be created at low sample sizes with multiple devices and signals from a single vehicle, or if there is a large volume of truck traffic. Both of these scenarios will create a large quantity of Wi-Fi matches in comparison to the actual volume of personal vehicles.

Table 11: ARID Wi-Fi Penetration Rate Summary

| | Port of Entry | Penetration Rate |
|---------------------------|---------------|------------------|
| San Luis | Exiting U.S. | 21.0% |
| DeConcini | Entering U.S. | 30.6% |
| | Exiting U.S. | 24.5% |
| Mariposa | Entering U.S. | 5.7% |
| | Exiting U.S. | 2.4% |
| Raul Hector Castro | Entering U.S. | 25.8% |
| | Exiting U.S. | 32.0% |
| Lukeville* | Exiting U.S. | 64.5% |
| Naco* | Entering U.S. | 53.5% |
| | Exiting U.S. | 27.8% |

Excluding the Lukeville and Naco POEs, the penetration rate analysis showed the greatest success (in descending order) at the Raul Hector Castro, DeConcini, San Luis, and Mariposa Ports of Entry.

The other factor is the amount of delay experienced at each POE, which involves the average annual vehicle delay. In terms of the most significant vehicle delay, the POEs are ranked as follows: Raul Hector Castro, DeConcini, San Luis, Mariposa, Lukeville, and Naco.

The delay analysis and the ARID success evaluation both conclude similar results in terms of prioritization. The list of recommended ARID device implementation locations is shown in Table 12.

Table 12: Prioritization of Future ARID Device Installation

| Rank | Port of Entry | Disposition |
|------|----------------------|---|
| 1 | DeConcini / Mariposa | Recommended for simultaneous ARID implementation, with further evaluation of sensor location at the Mariposa POE due to low penetration rates observed for this study |
| 2 | Raul Hector Castro | Recommended for ARID implementation |
| 3 | San Luis | Recommended for ARID implementation |
| 4 | Lukeville | Not recommended due to low volumes, unless peak periods are a concern |
| 5 | Naco | Not recommended due to low volumes, unless peak periods are a concern |

There are additional factors that should be considered before ARID device installation. The success of the ARID technology to determine wait times of personal vehicles at POEs depends on the type of vehicles crossing through the port of entry, the amount of probe vehicles (sample size), the proximity of the ARID device to vehicle flow, and any possible interference of nearby devices. Permanent ARID implementation at each Port of Entry should undergo Project Scoping to define the design concept, schedule, and cost of the project. ARID devices can be installed inside existing ADOT traffic signal or ITS cabinets with existing power and communications for approximately \$2,500. This type of infrastructure does not exist at every Port of Entry and does not exist in Mexico. The planning level design and construction cost for a single, stand-alone permanent ARID device is approximately \$28,000 as detailed in Table 13.

Table 13: Estimated Cost of Future ARID Device Installation

| Item No. | Description | Unit | Est. Qty | Unit Price | Extended Price |
|--|---|------|----------|------------|-----------------|
| 7340103 | CONTROL CABINET | EACH | 1 | \$4,000.00 | \$4,000 |
| 7340304 | CONTROL CABINET FOUNDATION (CABINET & TRANSFORMER) | EACH | 1 | \$1,000.00 | \$1,000 |
| 7370480 | PROVIDE ELECTRICAL SERVICE (<i>cost varies greatly</i>) | EACH | 1 | \$8,000.00 | \$8,000 |
| 9240120 | MISCELLANEOUS WORK (ETHERNET SWITCH) | EACH | 1 | \$800.00 | \$800 |
| 9240133 | MISCELLANEOUS WORK (Wireless Radio Assembly) | EACH | 1 | \$2,500.00 | \$2,500 |
| 9240121 | MISCELLANEOUS WORK (ARID Sensor) | EACH | 1 | \$2,500.00 | \$2,500 |
| SUBTOTAL | | | | | \$18,800 |
| TOTAL | | | | | |
| <i>Including Design, traffic control, System integration, Contingency, Communications and other Miscellaneous (1.5*Subtotal)</i> | | | | | \$28,200 |

PRINCIPAL FINDINGS

This study evaluated the capabilities and limitations of using ARID technology to measure wait times of U.S. and Mexico bound personal vehicles. The analysis concluded the following:

- The ARID technology was successful in identifying unique vehicle matches between two locations across the border, which allowed for crossing time data collection and wait time, delay, and average speed analysis.
- The pilot study of ARID travel time data collection using Wi-Fi technology resulted in higher penetration rates for this Port of Entry study application than using Bluetooth technology.
- ARID travel time data collection using Wi-Fi technology resulted in higher penetration rates for this Port of Entry study application than other Arizona deployments on freeways and urban arterial roadways within the past year.
- Of the four POEs with data both entering and exiting the U.S., three had higher ARID penetration rates of passenger vehicles entering the U.S.
- ARID (Wi-Fi) technology collects enough valid data to estimate border crossing times with 95% confidence, with the exception of the Mariposa POE in the northbound direction. This is due to low penetration rates at the Mariposa POE, which may have been related to deployment location or technology interference.
- The highest average individual vehicle delay entering the U.S. was observed at the Mariposa POE (5.46 minutes).
- The DeConcini POE has the greatest estimated average daily vehicle delay (303 vehicle-hours).

RECOMMENDATIONS

The implementation of permanent ARID devices at the Arizona-Mexico border are recommended in the following order, based on the amount of delay experienced at each location, the total personal vehicle volume, and the success of the ARID Wi-Fi deployments:

1. DeConcini/Mariposa
2. Raul Hector Castro
3. San Luis
4. Lukeville
5. Naco

The implementation of the ARID devices, specifically at the DeConcini, Mariposa, Raul Hector Castro, and San Luis Ports of Entry are expected to have the greatest impact and allow for the greatest vehicle flow and corresponding delay to be monitored and reported. Although the implementation at the Lukeville and Naco POEs would also yield beneficial wait time information and analysis, the significantly lower vehicle volumes lessens their priority. The DeConcini and Mariposa POEs are recommended to be implemented together with highest priority due to the observed vehicle delay, annual volumes, and close proximity in location allowing them to serve as alternate routes to each other. The DeConcini and Mariposa Ports of Entry are located approximately 1.4 miles (2.25 km) apart in Nogales, Arizona/Sonora, and have a combined annual vehicle volume of 3,286,532.

Permanent ARID implementation at each Port of Entry should undergo Project Scoping to define the design concept, schedule, and cost of the project. The planning level design and construction cost for a single, stand-alone permanent ARID device is approximately \$28,000. This cost is highly dependent on the cost to provide electrical service to the site. Deployment at sites with existing power and communications infrastructure will significantly reduce implementation costs.

APPENDIX C

PENETRATION RATE ANALYSIS

ANALYSIS OF BLUETOOTH AND WI-FI TECHNOLOGY
TO MEASURE WAIT TIMES OF PERSONAL VEHICLES AT ARIZONA-MEXICO PORTS OF ENTRY

PENETRATION RATE SUMMARY

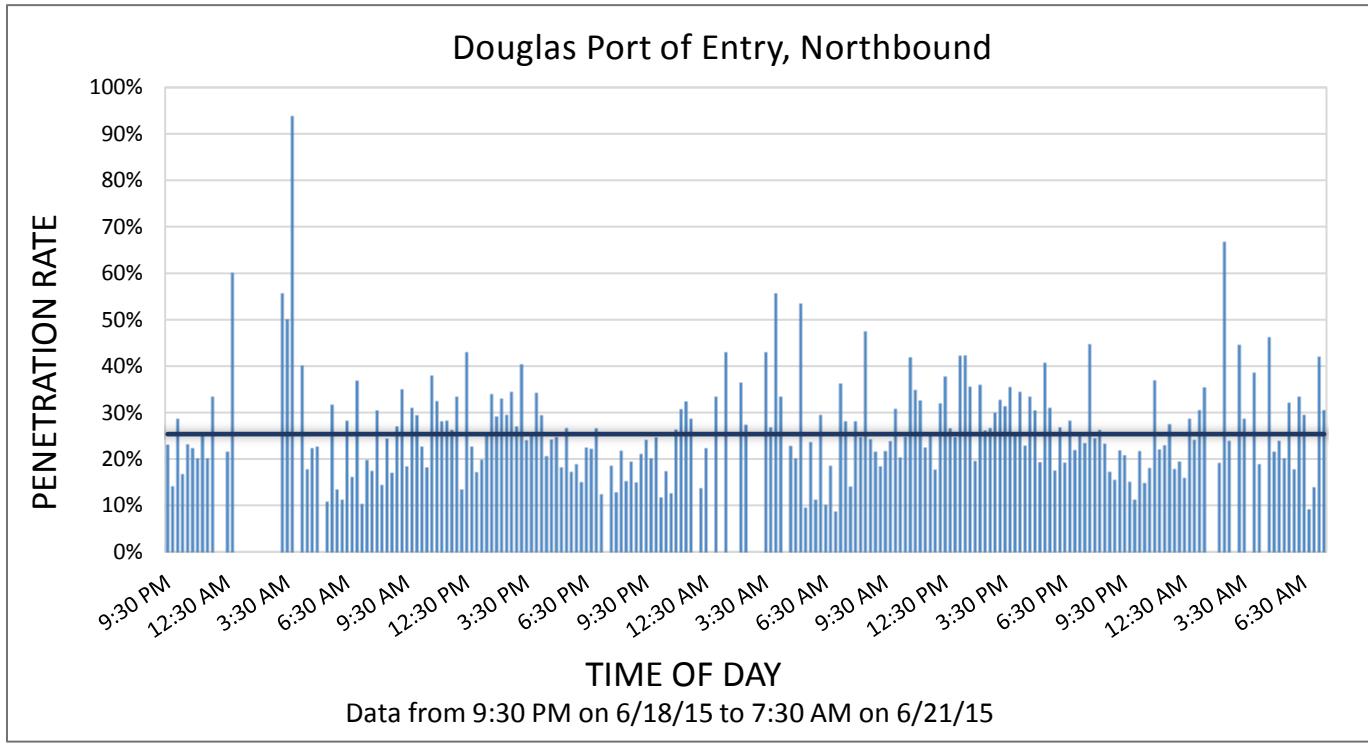

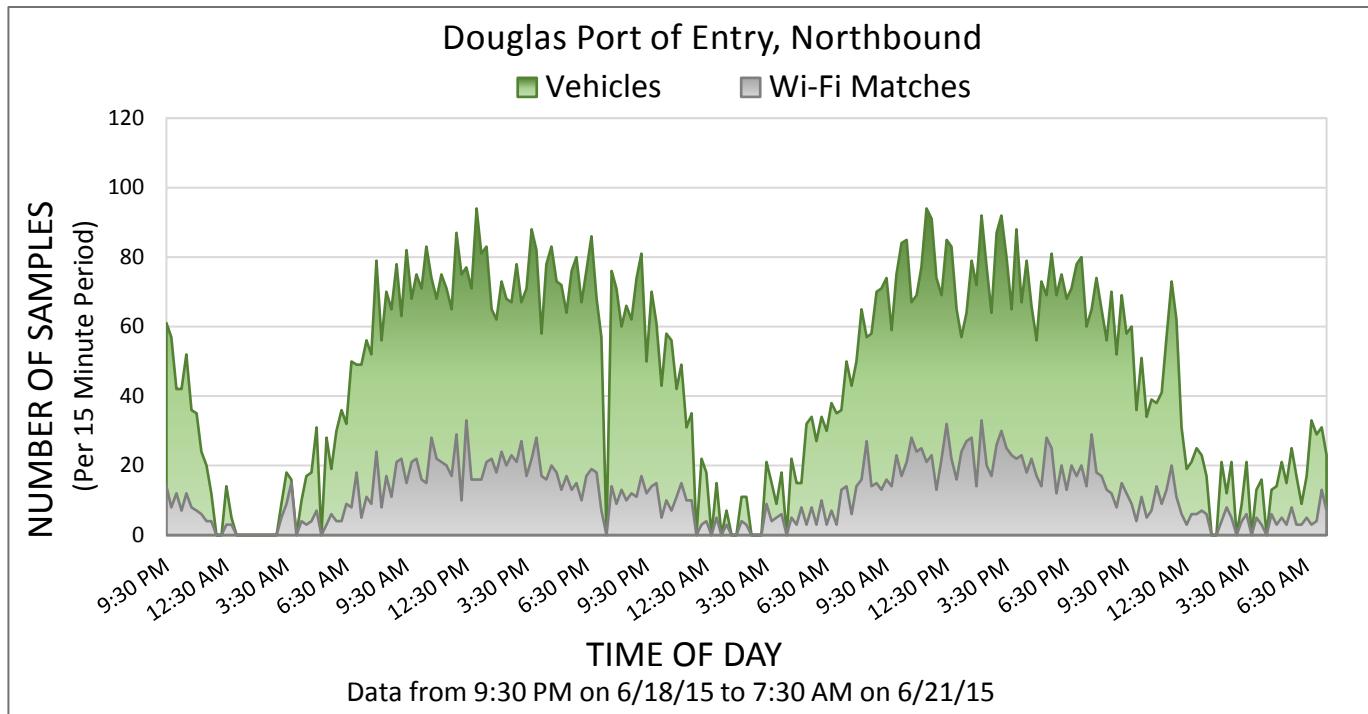

Douglas Port of Entry

Thursday, June 18 - Sunday, June 21, 2015

Douglas, Arizona

Northbound - POE to US

Average Penetration Rate: **25.8%**

*Note: 15 minute periods with insufficient data were excluded from analysis (< 3 samples; ARID or Miovision)

PENETRATION RATE SUMMARY

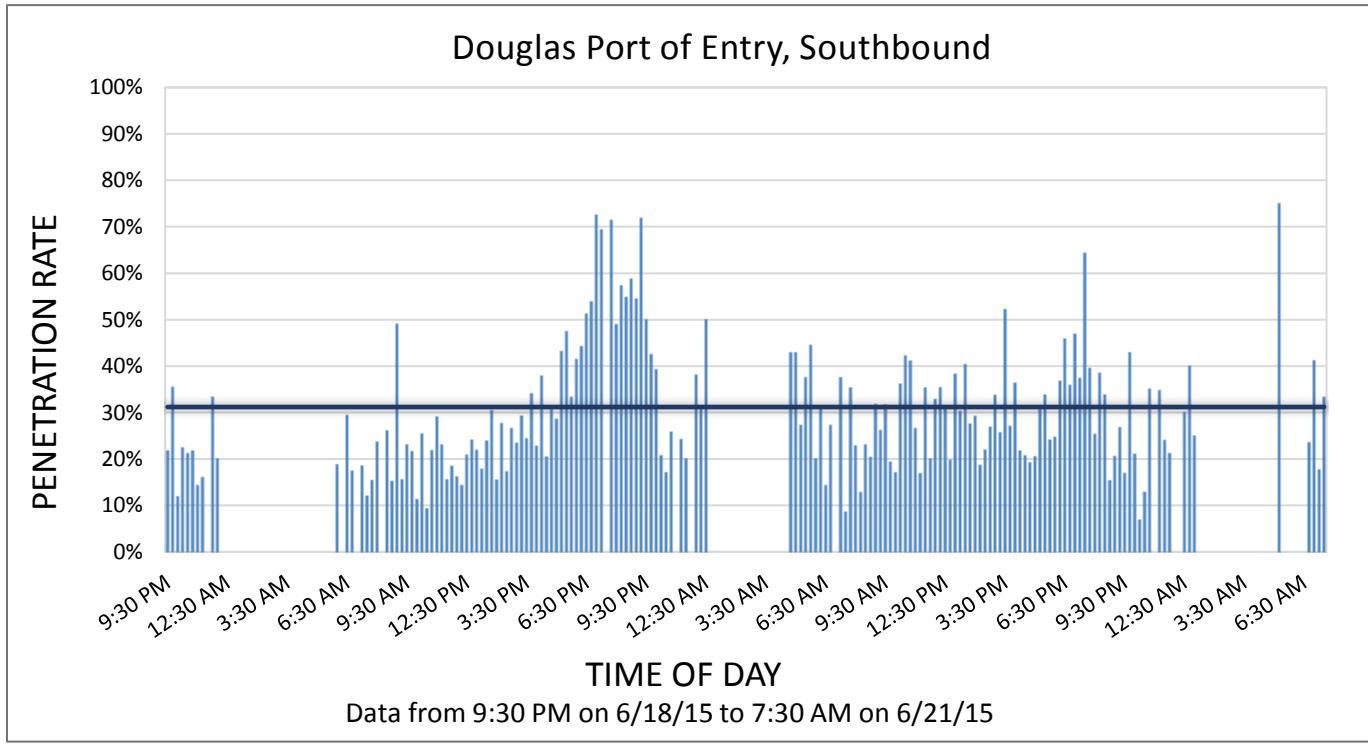

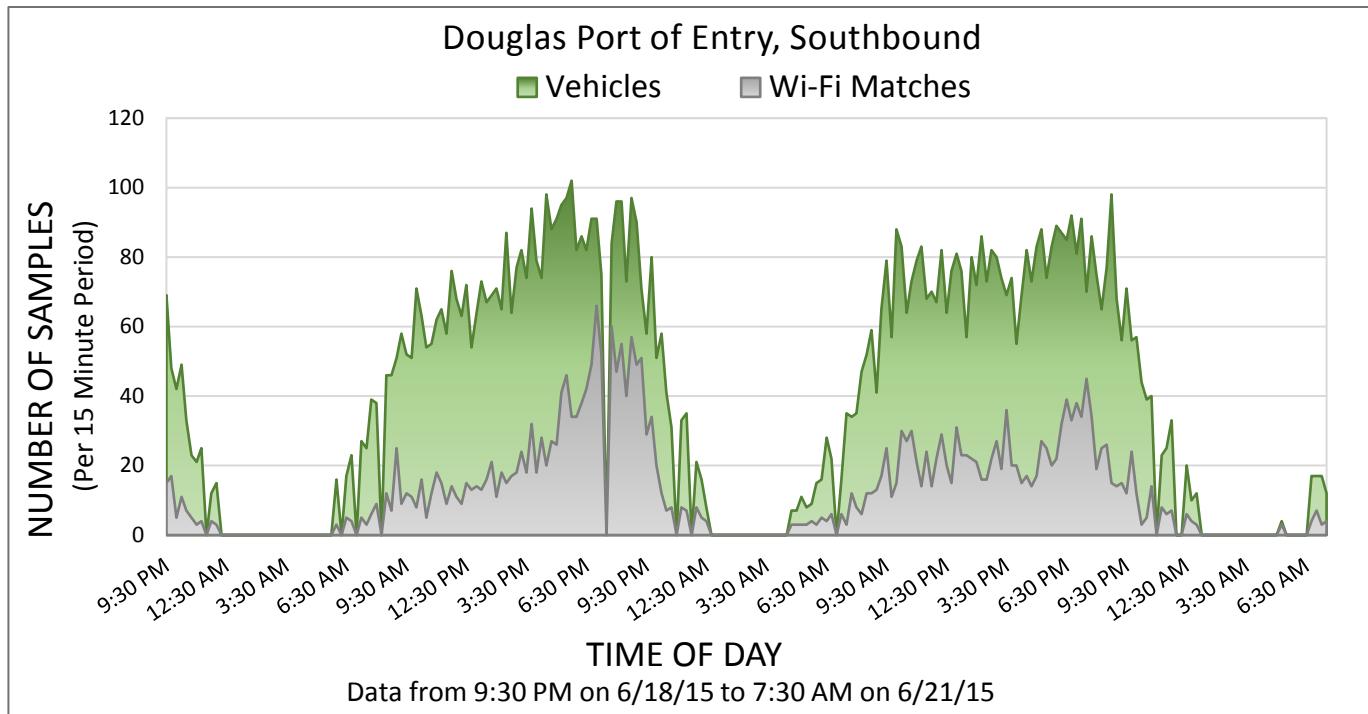

Douglas Port of Entry

Thursday, June 18 - Sunday, June 21, 2015

Douglas, Arizona

Southbound - US to POE

Average Penetration Rate: **32.0%**

*Note: 15 minute periods with insufficient data were excluded from analysis (< 3 samples; ARID or Miovision)

PENETRATION RATE SUMMARY

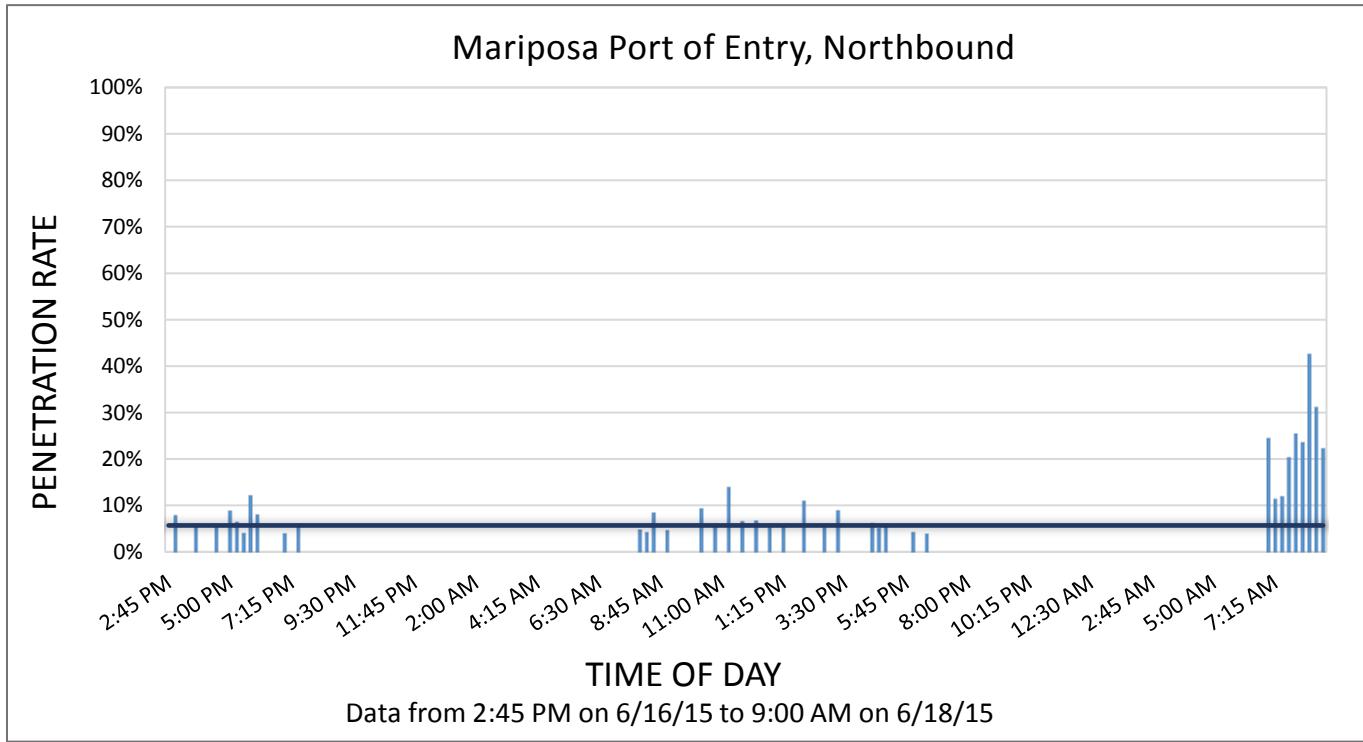

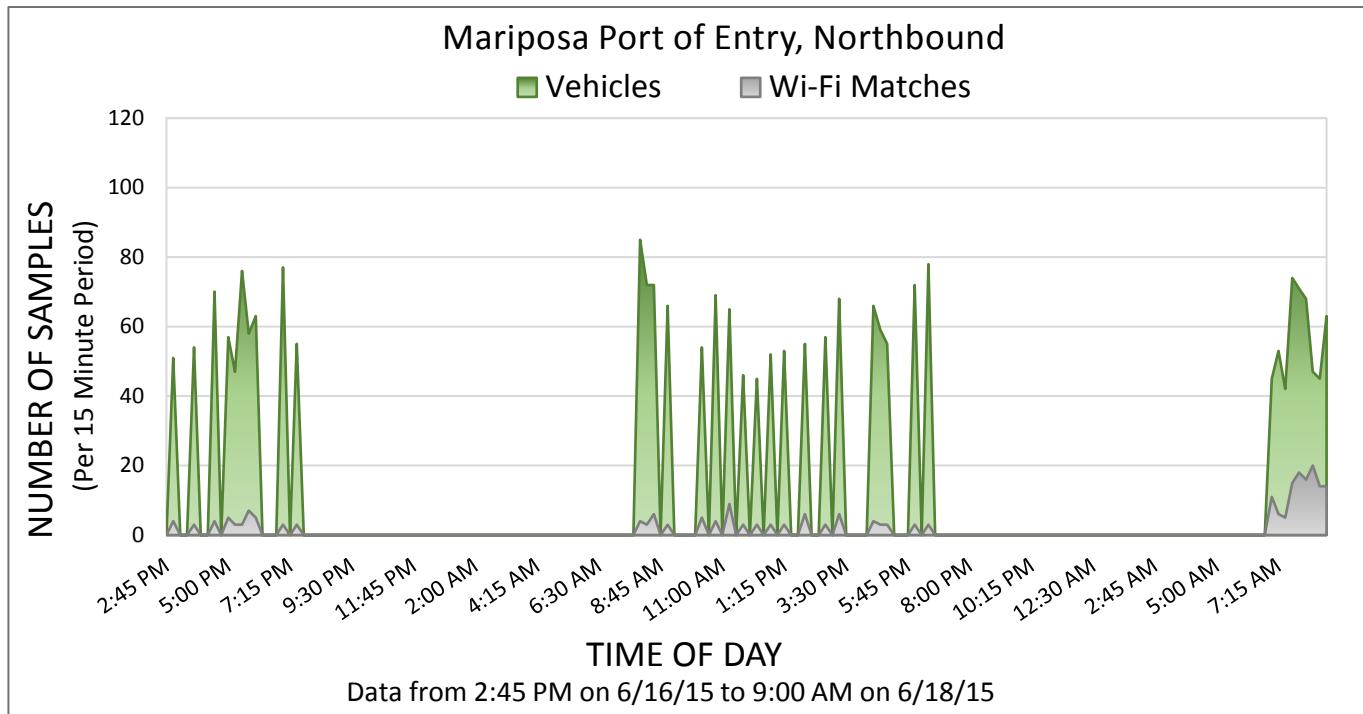

Mariposa Port of Entry

Tuesday, June 16 - Thursday, June 18, 2015

Nogales, Arizona

Northbound - POE to US

Average Penetration Rate: **5.7%**

*Note: 15 minute periods with insufficient data were excluded from analysis (< 3 samples; ARID or Miovision)

PENETRATION RATE SUMMARY

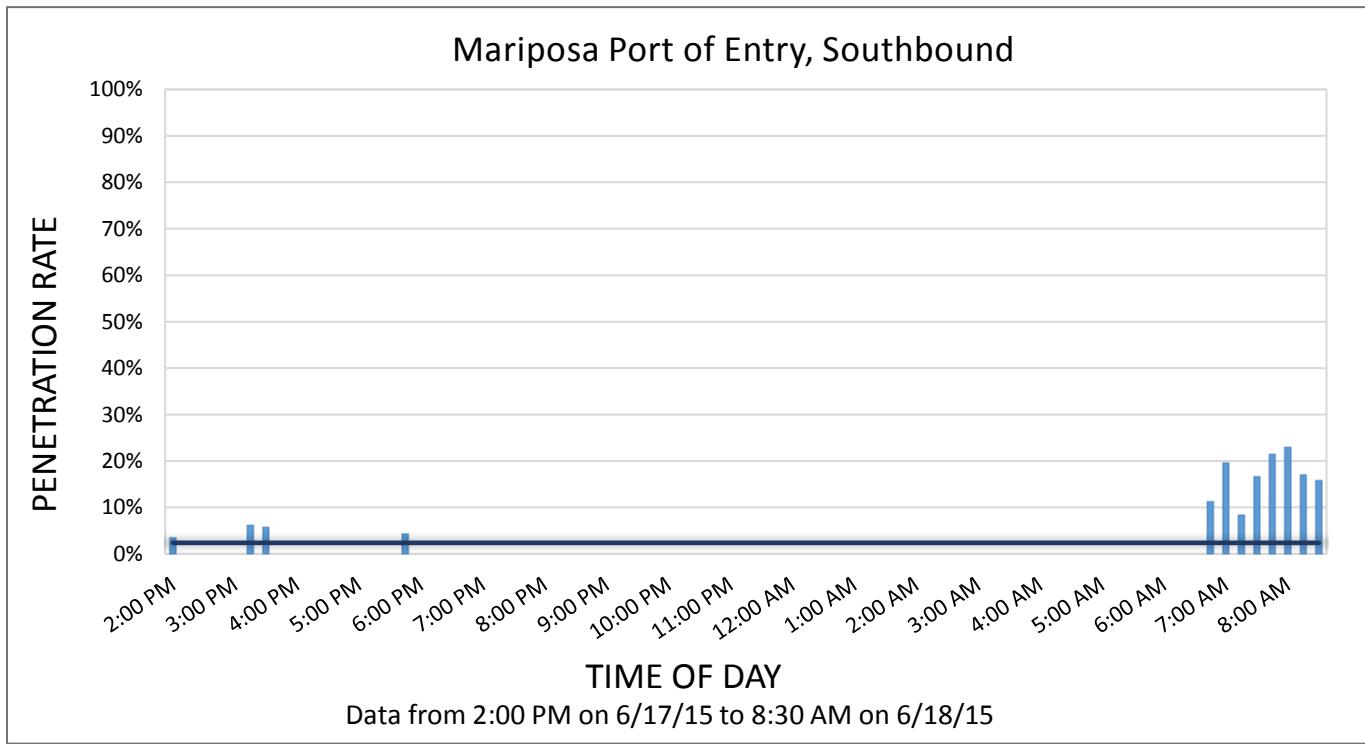

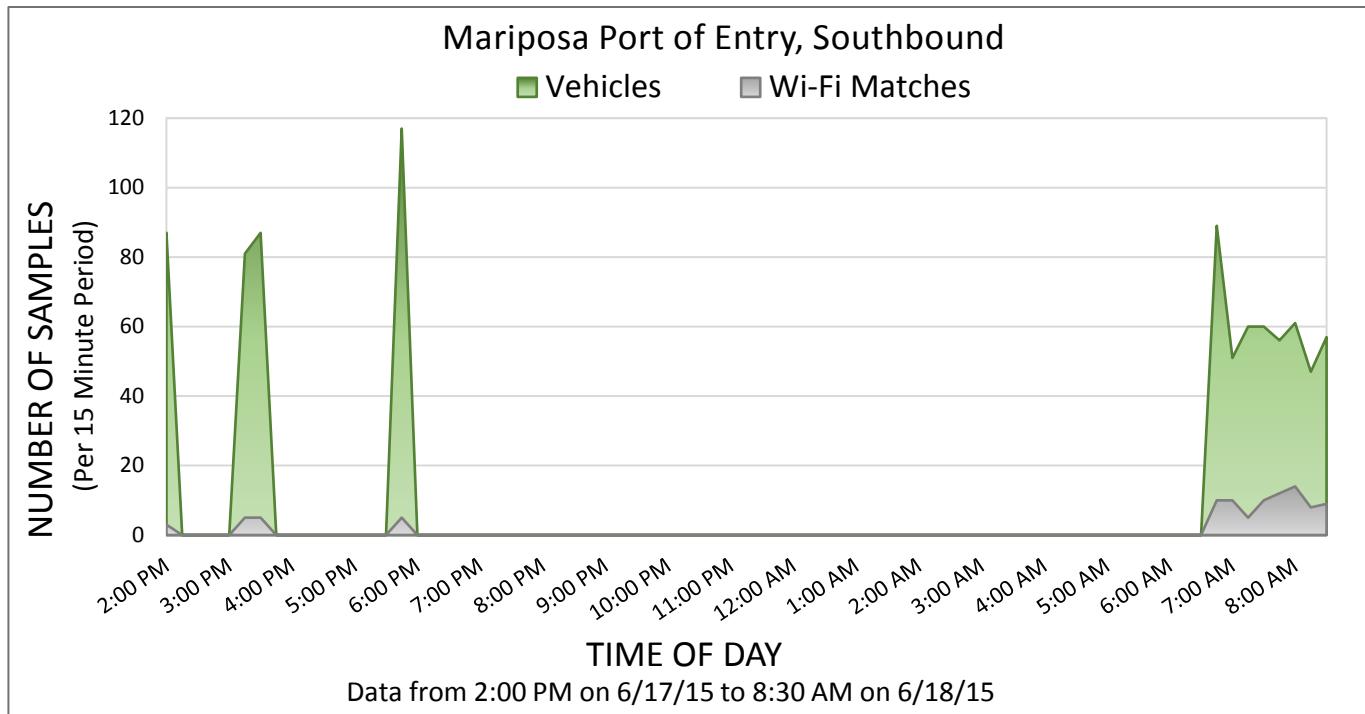

Mariposa Port of Entry

Tuesday, June 16 - Thursday, June 18, 2015

Nogales, Arizona

Southbound - US to POE

Average Penetration Rate: **2.4%**

*Note: 15 minute periods with insufficient data were excluded from analysis (< 3 samples; ARID or Miovision)

PENETRATION RATE SUMMARY

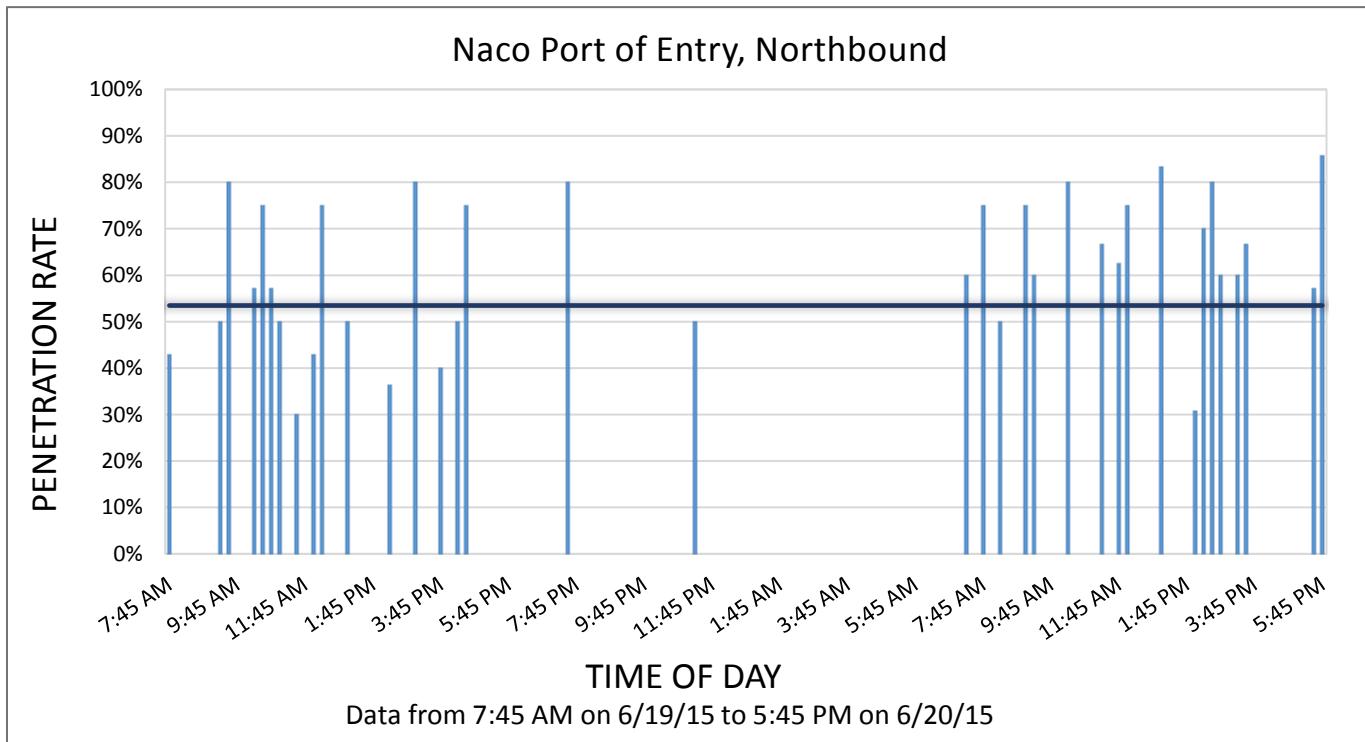

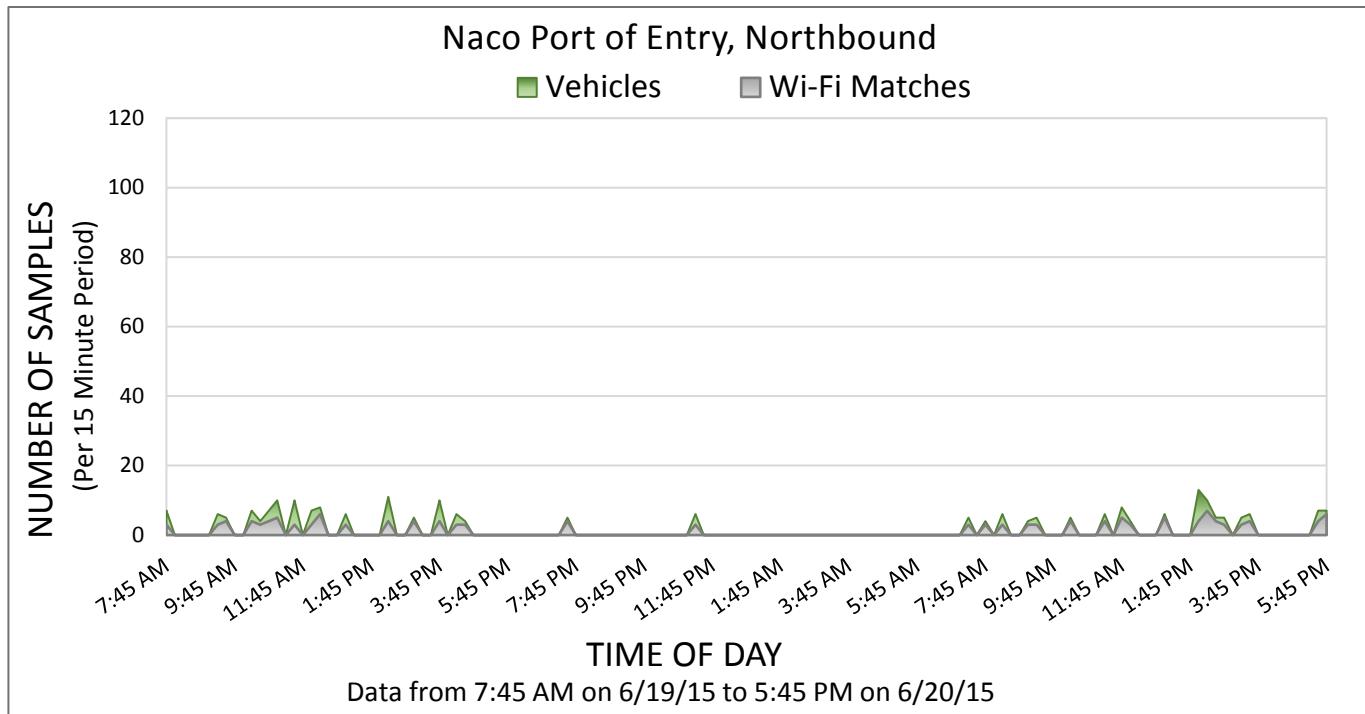

Naco Port of Entry

Friday, June 19 - Saturday, June 20, 2015

Naco, Arizona

Northbound - POE to US

Average Penetration Rate: **53.5%**

*Note: 15 minute periods with insufficient data were excluded from analysis (< 3 samples; ARID or Miovision)

PENETRATION RATE SUMMARY

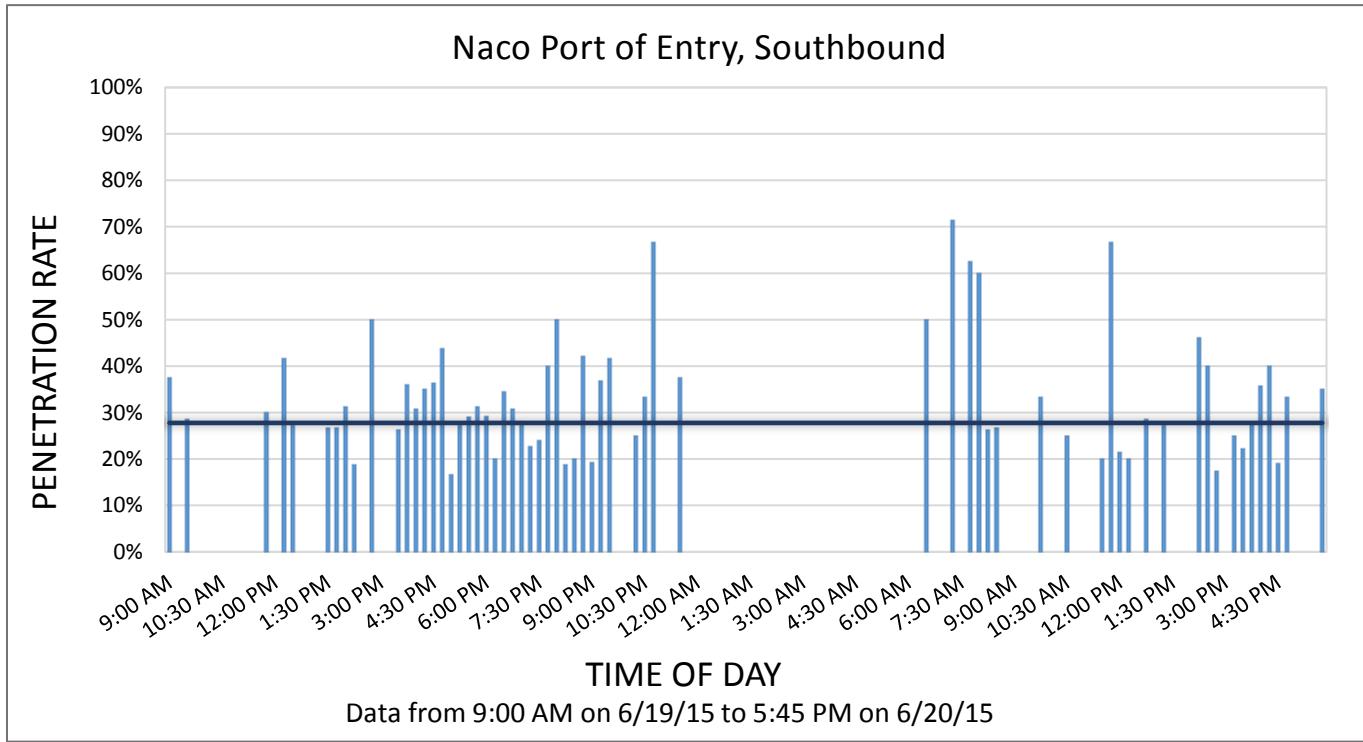

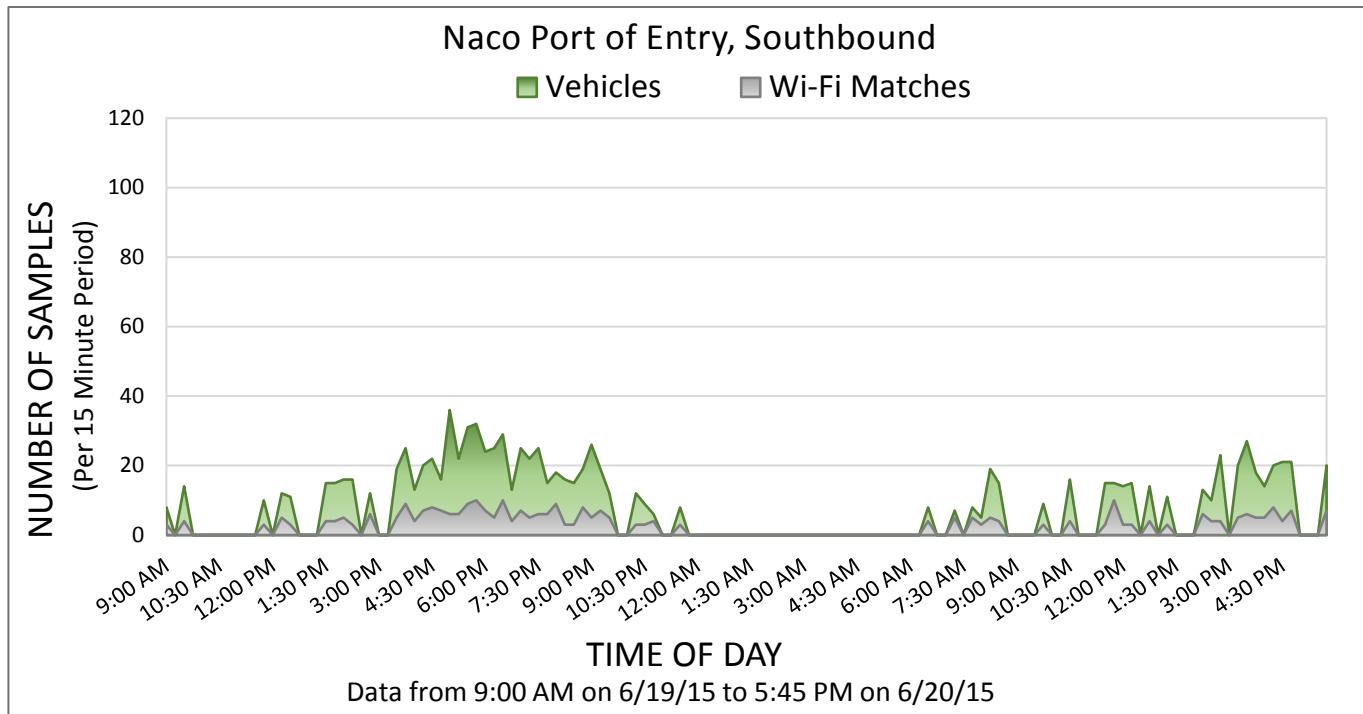

Naco Port of Entry

Friday, June 19 - Saturday, June 20, 2015

Naco, Arizona

Southbound - US to POE

Average Penetration Rate: **27.8%**

*Note: 15 minute periods with insufficient data were excluded from analysis (< 3 samples; ARID or Miovision)

PENETRATION RATE SUMMARY

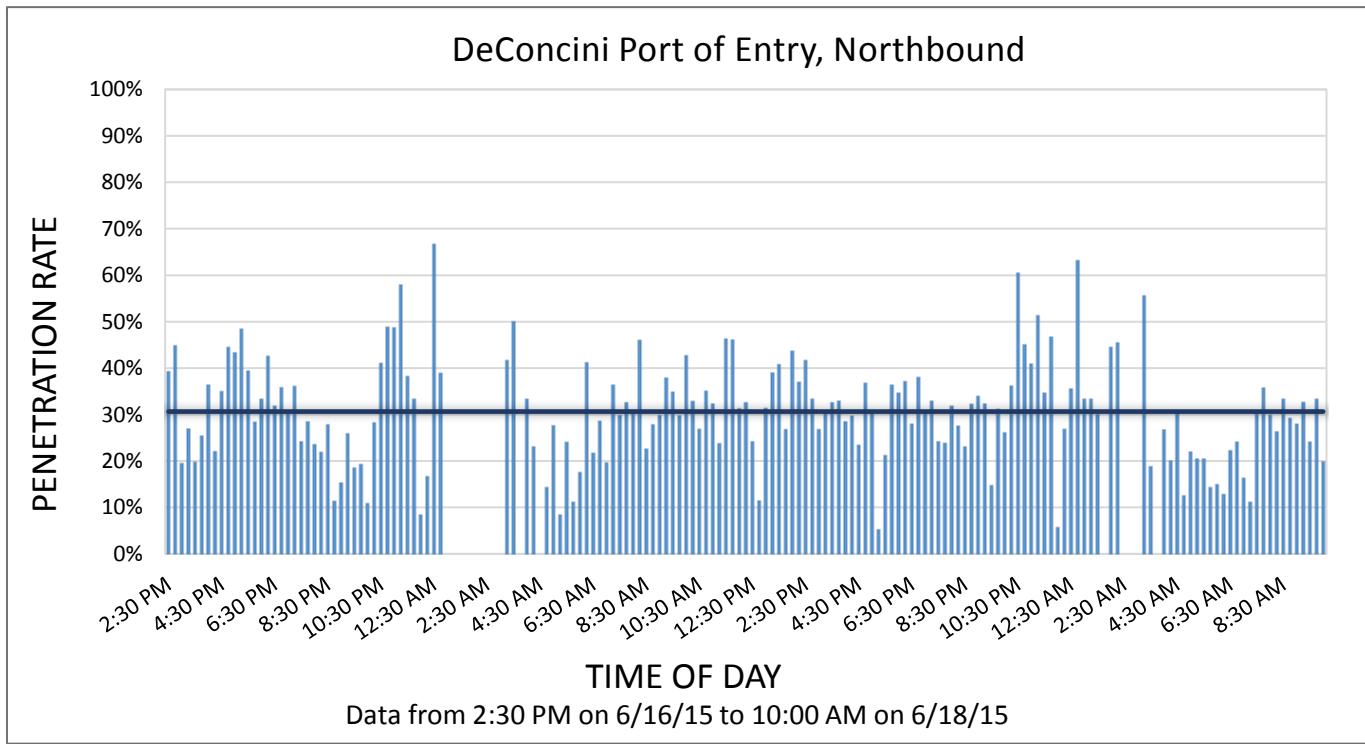

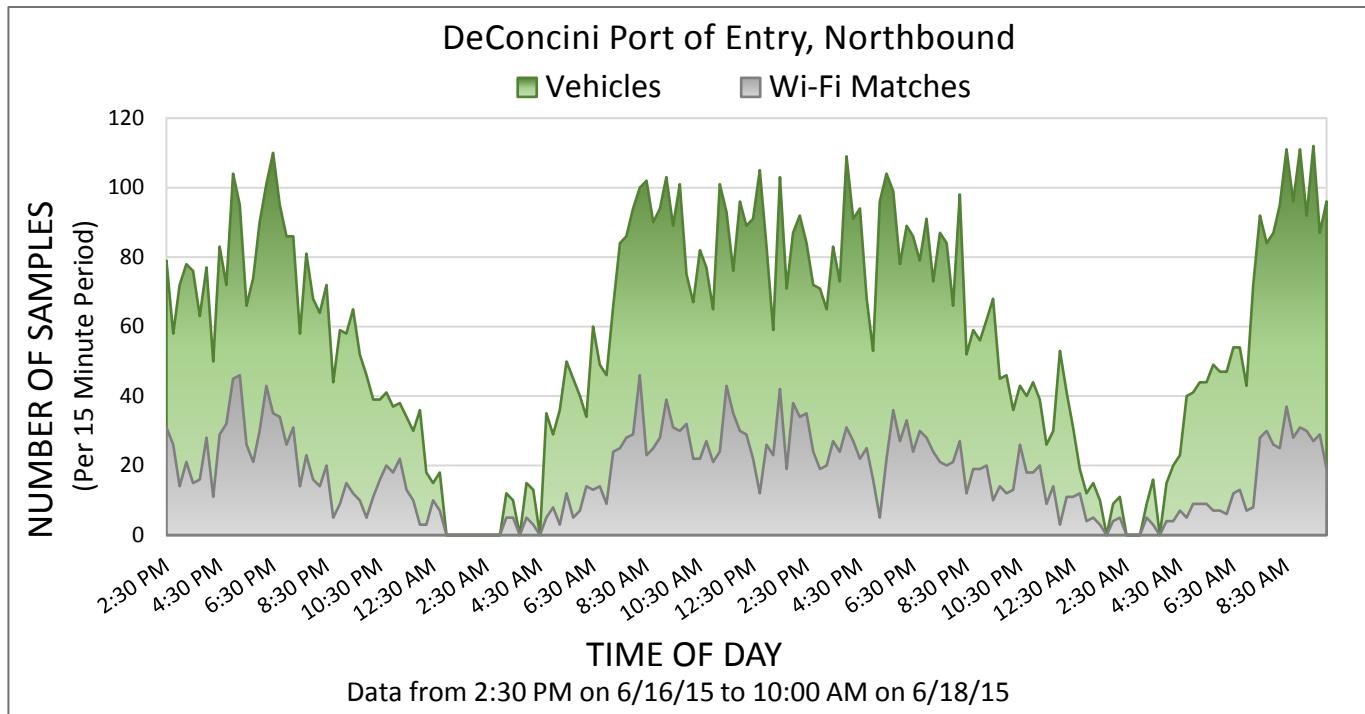

DeConcini Port of Entry

Tuesday, June 16 - Thursday, June 18, 2015

Nogales, Arizona

Northbound - POE to US

Average Penetration Rate: **30.6%**

*Note: 15 minute periods with insufficient data were excluded from analysis (< 3 samples; ARID or Miovision)

PENETRATION RATE SUMMARY

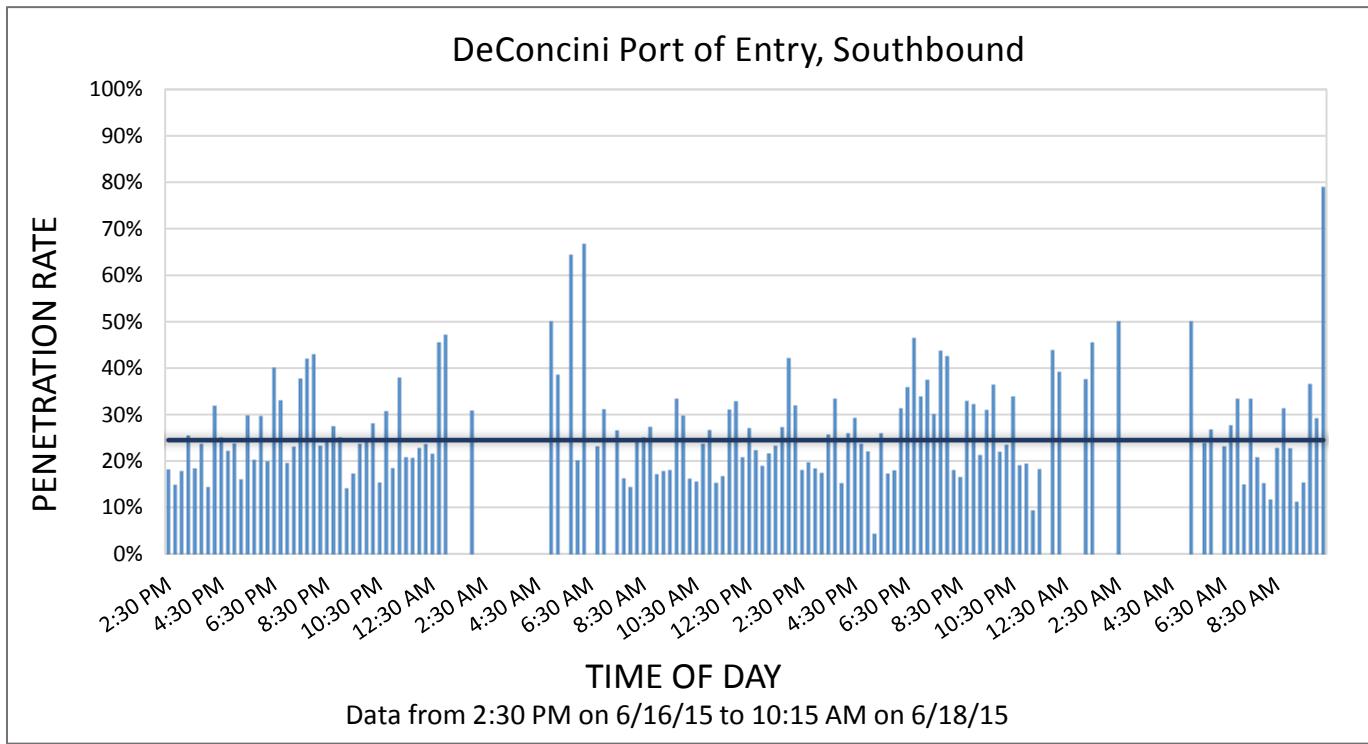

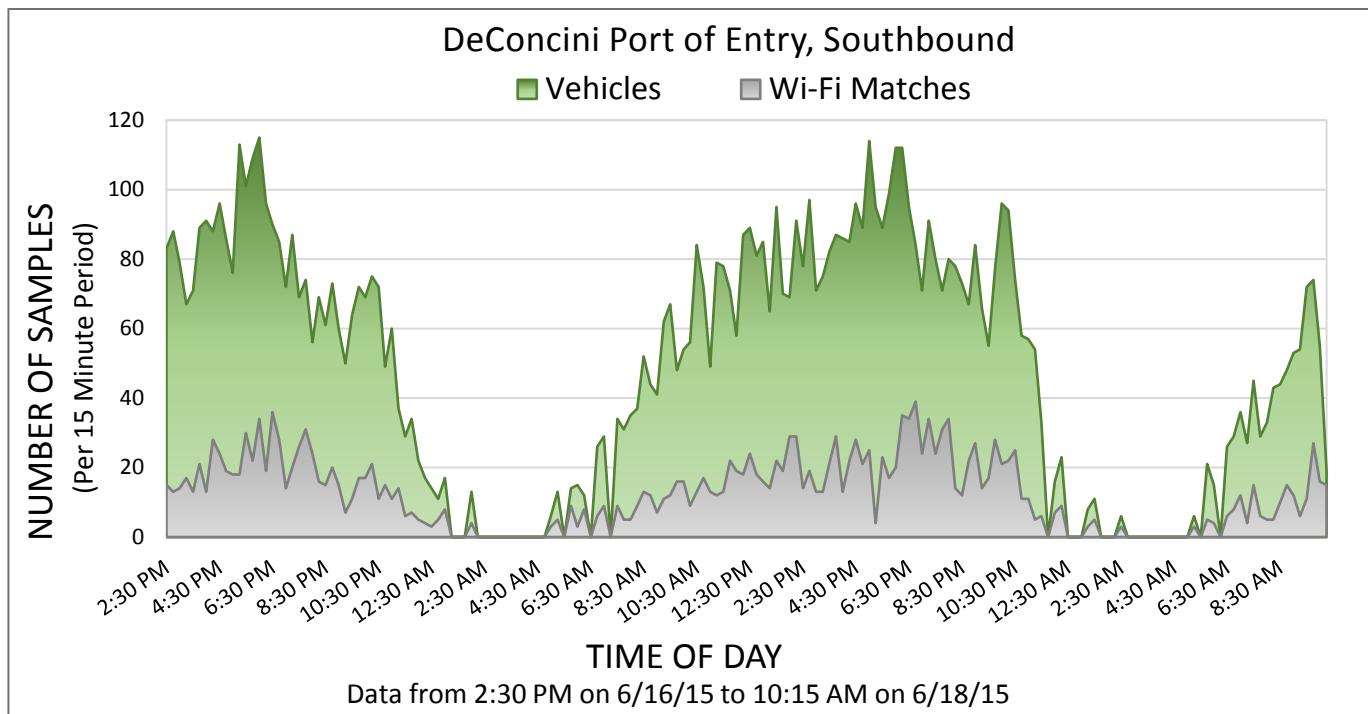

DeConcini Port of Entry

Tuesday, June 16 - Thursday, June 18, 2015

Nogales, Arizona

Southbound - US to POE

Average Penetration Rate: **24.5%**

*Note: 15 minute periods with insufficient data were excluded from analysis (< 3 samples; ARID or Miovision)

PENETRATION RATE SUMMARY

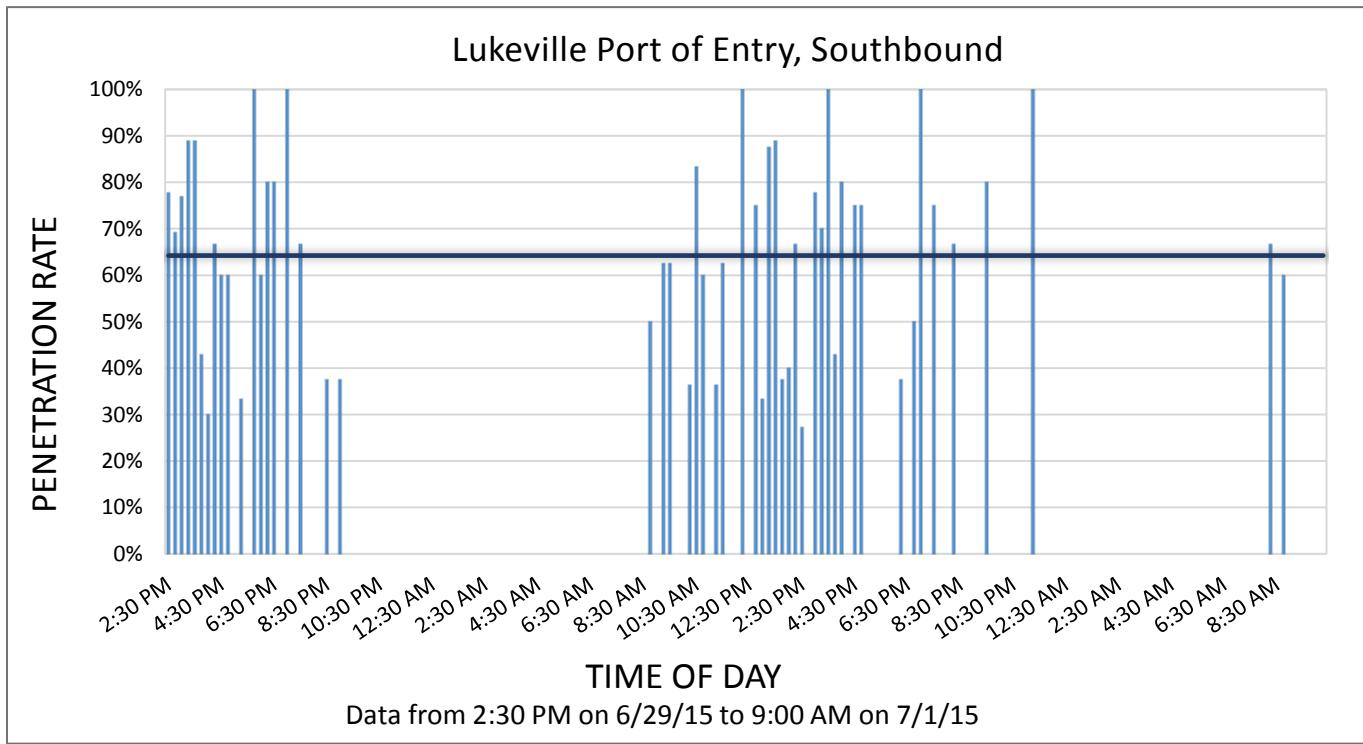

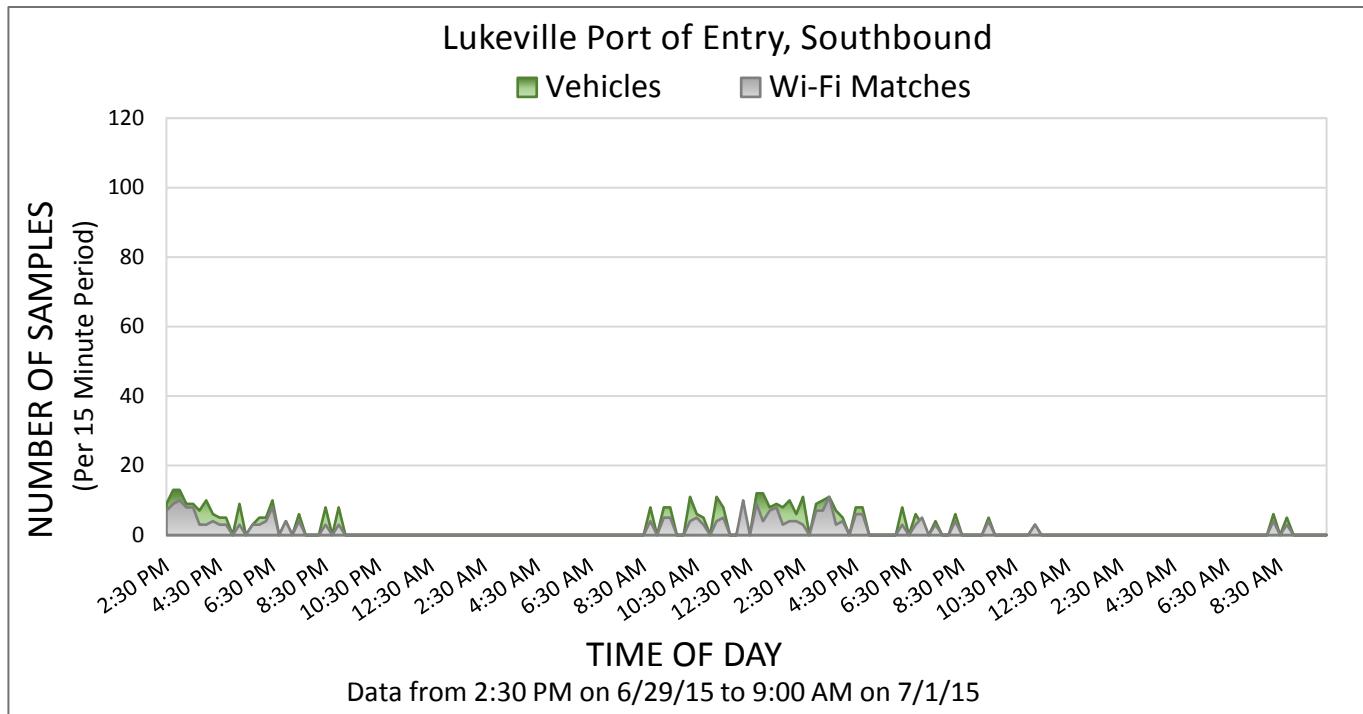

Lukeville Port of Entry

Monday, June 29 - Wednesday, July 1, 2015

Lukeville, Arizona

Southbound - US to POE

Average Penetration Rate: **64.2%**

*Note: 15 minute periods with insufficient data were excluded from analysis (< 3 samples; ARID or Miovision)

PENETRATION RATE SUMMARY

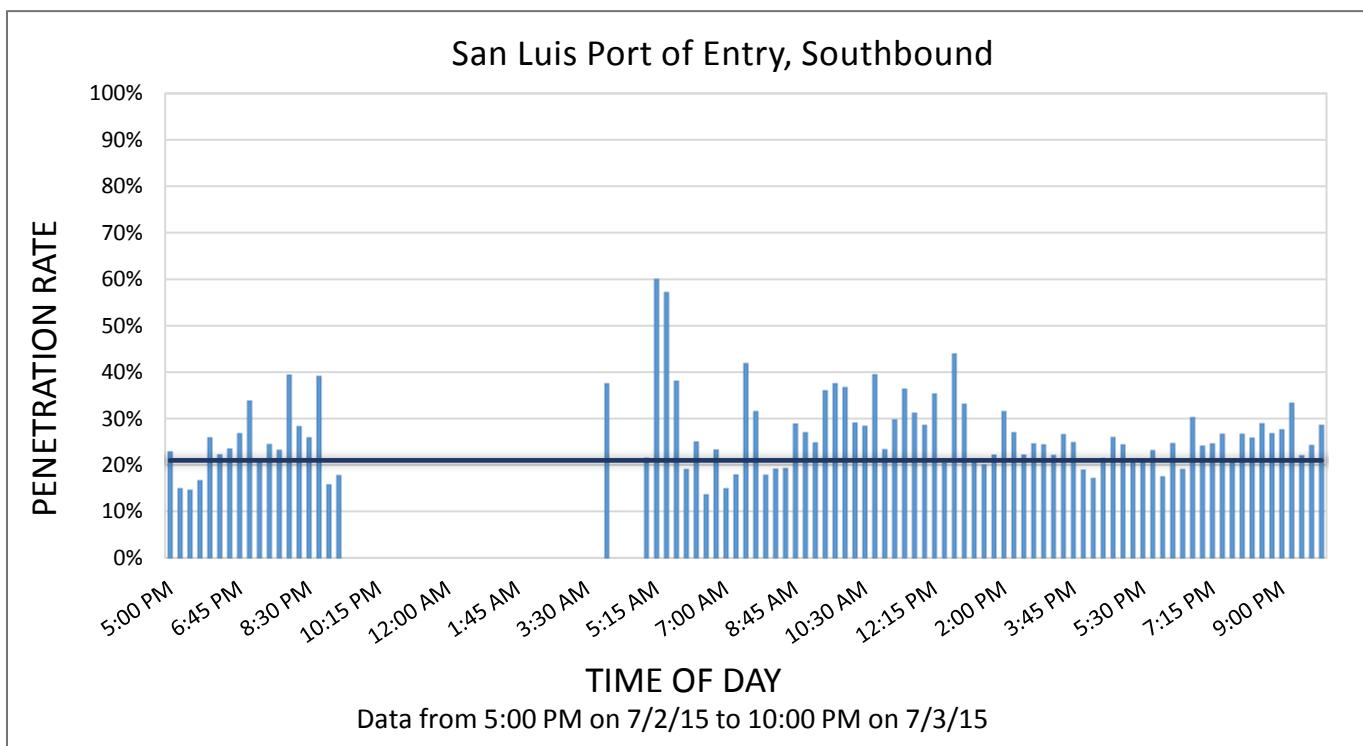

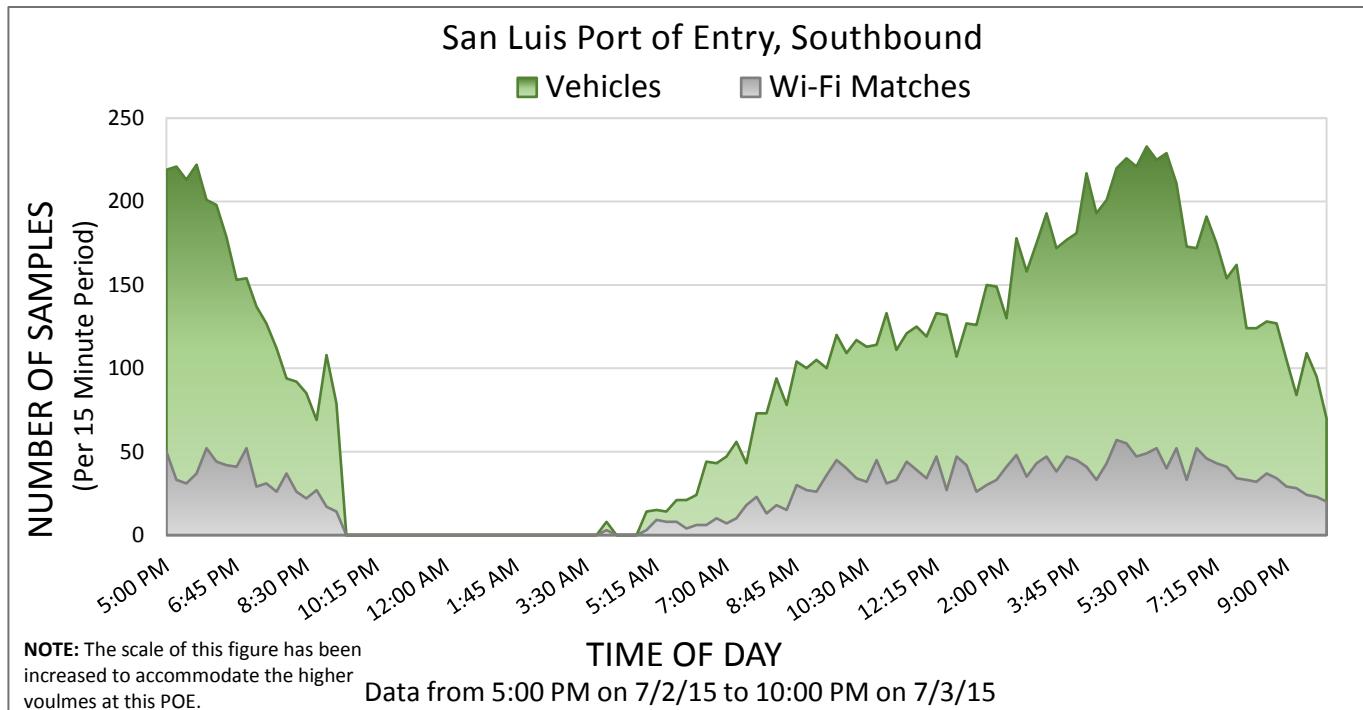

San Luis Port of Entry

Thursday, July 2 - Saturday, July 4, 2015

San Luis, Arizona

Southbound - US to POE

Average Penetration Rate: **21.0%**

*Note: 15 minute periods with insufficient data were excluded from analysis (< 3 samples; ARID or Miovision)

APPENDIX D
